Electric Sales, Revenue, and Bills 1988

Energy Information Administration
Office of Coal, Nuclear, Electric and Alternate Fuels
U.S. Department of Energy
Washington, DC 20585

Introduction

In response to requests for comprehensive data on sales, revenue, and bills for electricity at the national, regional, State, and electric utility level, the Energy Information Administration (EIA) has replaced the publication, *Typical Electric Bills* with a new publication, *Electric Sales, Revenue, and Bills*. The new publication presents a summary of electric utility statistics at the national, regional, State and electric utility level. The objective of the publication is to provide industry decisionmakers, government policymakers and the general public with historical data that may be used in forming various perspectives on electric power issues.

The *Electric Sales, Revenue, and Bills* is prepared by the Electric Power Division, Office of Coal, Nuclear, Electric and Alternate Fuels; Energy Information Administration (EIA); U.S. Department of Energy. The publication provides information about sales, revenue, average revenue per kilowatthour of electricity sold, and typical monthly electric bills to residential, commercial, and industrial consumers throughout the United States.

In order to provide a better comprehension of the cost of electricity to the consumer, both average revenue per kilowatthour and typical electric bills are provided in the *Electric Sales, Revenue, and Bills*. The average revenue per kilowatthour provided in this report is based on annual data reported by electric utilities for the calendar year ending December 31, 1988. Average revenue per kilowatthour is calculated by dividing retail sales into the associated electric revenue. The electric revenue reported by each electric utility includes the revenue billed for the amount of kilowatthours sold, revenue from State and local taxes, energy or demand charges, consumer service charges, environmental surcharges, franchise fees, fuel adjustments, and other miscellaneous charges. The average revenue per kilowatthour of electricity sold, sales of electricity, and associated revenue provided in this report are presented at the national, Census, State, and electric utility levels.

The monthly electric bills provided in this report represent *typical net* bills reported by electric utilities based on the specific rate in effect on January 1, 1989, that is applicable to the largest number of their consumers at specified levels of demand and consumption. These bills are those that the electric utilities would have issued had their consumers consumed in one month the specified amount of electricity. Conse-

quently, bills in this report are typical rather than actual. They are also not all-inclusive, since they do not capture all consumption levels and rate schedules. Since the bills do not include some taxes, such as sales taxes, they are considered *net* bills.

Since the data regarding retail sales of electricity and associated revenue are used as the basis for deriving an average revenue per kilowatthour across all consumption levels rather than the retail cost at specific levels of demand and consumption, a direct comparison cannot be made with the bills provided in this report. For more information on this subject, see the "Background" section in the Profile of this report.

Target Audience

In the private sector, users of the *Electric Sales, Revenue, and Bills* should include researchers, analysts, and ultimately the policy- and decision-making members of electric utility companies. Financial and investment institutions, economic development organizations interested in new power plant construction, special interest groups, lobbyists, electric power associations, and the news media should find the data in this report useful.

In the public sector, users include the Congress, public service or utility commissions, analysts, researchers, statisticians, and other professionals engaged in regulatory, policy, and program areas for Federal, State, and local governments.

Coverage of Sources

Data published in the *Electric Sales, Revenue, and Bills* are compiled from two statistical forms filed annually by electric utilities. The forms are: the Form EIA-861, "Annual Electric Utility Report," and the Form EIA-213, "Typical Net Monthly Bills." A brief description of each of these forms follows. These forms are described in more detail in Appendix C, "Technical Notes."

The Form EIA-861 is a census of electric utilities in the United States, its territories, and Puerto Rico. The form is used to collect information on the production and sale of electricity from approximately 3,250 electric

utilities. This publication presents data on the number of consumers, sales, and revenue reported on the Form EIA-861. The average revenue per kilowatthour of electricity sold presented in this publication is calculated by dividing sales into revenue (in other EIA reports, revenue per kilowatthour was defined as "average price"). Since electric rates vary based on energy usage, average revenue per kilowatthour is affected by changes in the volume of sales. The data on sales, revenue, and average revenue per kilowatthour presented in this publication differ somewhat from estimated data collected on the Form EIA-826, "Monthly Electric Sales and Revenue Report with State Distributions," published in the *Electric Power Monthly* and in the *Electric Power Annual* for 1987 and prior years. Both forms use sectoral classifications based on the usual classification of consumers by electric utilities. At the national level, the Forms EIA-861 and EIA-826 figures correspond fairly closely; however, some large differences have been observed at the State level (for a more detailed discussion, see Appendix C). Data for Puerto

Rico are included only in Table 14 and not in the summary statistics.

The Form EIA-213 is used to collect information on electric bills to consumers for residential, commercial, and industrial service in the United States. With the exception of rural electric cooperatives (from which the Department of Agriculture collects data), a form is sent to each electric utility that provides residential service to communities with a population of 2,500 or more. These communities are based on the *1980 Census of Population*, the Bureau of the Census, U.S. Department of Commerce. Typical monthly bills are collected for residential electric service at 5 specific levels of consumption for each community with a population of 2,500 or more. Bills are collected for commercial service at 6 specific levels of demand/consumption and for industrial service at 10 specific levels of demand/consumption for each community with a population of 50,000 or more. For States with fewer than 3 communities of that size, data are collected for the 3 largest communities.

Profile

This chapter contains two sections. The "Background" section provides a discussion on 1) how average revenue per kilowatthour and typical net monthly bills differ; 2) the classes of electric utility ownership; and, 3) the classes of service or sectors. The "Year at a Glance" section provides a summary of pertinent statistics during the year related to sales of electricity to ultimate consumers, electric revenue from those sales, and average revenue per kilowatthour of electricity sold.

Background

The average revenue per kilowatthour of electricity sold is calculated by dividing retail electric revenue by the corresponding sales of electricity. The average revenue per kilowatthour is calculated for all consumers and for each sector (residential, commercial, industrial, and other). In contrast, the typical net monthly bills are based only on the specific rate (as of January 1, 1989) applicable to the largest number of consumers within the service area of the utility at specified levels of demand and consumption. While the average revenue per kilowatthour and monthly bill for a specific sector are similar, they should not be directly compared.

Direct comparisons between the two data series cannot be made because the average revenue per kilowatthour represents an average of all consumption levels and rates while the monthly bill is calculated based on a specific rate and for different levels of consumption. Also, the electric revenue used to derive the average revenue per kilowatthour is the gross revenue reported by the electric utility while the monthly bills are net bills because they exclude certain taxes. Electric revenue includes State and local taxes, energy or demand charges, consumer service charges, environmental surcharges, franchise fees, fuel adjustments, and other miscellaneous charges primarily assessed by privately owned electric utilities. State and local taxes are collected by the electric utility as part of their billing process but are expensed out and passed along to the appropriate taxation authorities.

The monthly bills are net because they do not include some taxes and are typical, not actual, since they are based on a specified level of demand/consumption at a specific rate. Thus, the monthly bills do not represent an average across all levels of demand/consumption nor do they capture all rates. The bills represent only

those bills that the electric utility would have issued based on the specific rate in effect on January 1, 1989, applicable to the largest number of consumers at each specified demand/consumption level.

Average revenue per kilowatthour is affected by changes in the rate schedules used by the electric utilities and by changes in the volume of electricity sales. Because fixed charges remain constant regardless of the volume of sales, average revenue per unit of electricity sold will decrease as the volume of sales increases. A change in average revenue resulting from a change in the volume of electricity sales (due either to an increase/decrease in electricity use by the individual consumer or an increase/decrease in the number of ultimate consumers) may occur when the volume of sales changes either across all sectors or within a specific sector. Generally, the rate schedules used by electric utilities are designed such that revenue decreases as the volume of sales increases, lowering the average revenue. The net effect of these trends on the average revenue per kilowatthour of electricity sold in this publication has not been determined.

Average revenue per kilowatthour of electricity and typical net bills are impacted by class of utility ownership and by class of service (sector). Consequently, the data in this publication are presented by class of ownership and service.

Classes of Ownership. The electric power industry in the United States is a combination of privately, publicly, federally, and cooperatively owned electric utilities.

Like all private businesses, the fundamental objective of a privately owned (investor-owned) utility is to produce a return for its investors. The investor-owned electric utility either distributes its profits to stockholders as dividends or reinvests these profits. It is granted a service monopoly in certain geographic areas and is obliged to serve all consumers. As franchised monopolies, these utilities are regulated and required to charge reasonable prices, to charge comparable prices to similar classifications of consumers, and to give consumers access to services under similar conditions. Most investor-owned electric utilities are operating companies that provide basic services for the generation, transmission, and distribution of electricity. The majority of investor-owned utilities perform all three functions. Privately owned electric utilities currently ac-

count for more than 75 percent of all electric utility generating capability, generation, sales, and revenue in the United States.

Publicly owned utilities are nonprofit local government agencies established to serve their communities and nearby consumers at cost, returning excess funds to the consumer in the form of community contributions, more economic and efficient facilities, and lower rates. Publicly owned electric utilities (which number approximately 2,000) include municipals, public power districts, State authorities, irrigation districts, and other State organizations. Most municipal utilities simply distribute power, although some larger ones produce and transmit electricity as well. They obtain their financing from municipal treasuries and from revenue bonds secured by proceeds from the sale of electricity.

Electric cooperative utilities are established to provide electricity to their members, and are owned by their members. These electric utilities operate in rural areas with a lower concentration of consumers because these areas were historically viewed as uneconomical operations for privately owned electric utilities. They are incorporated under State law and are usually directed by an elected board of directors, which in turn selects a manager. Electric cooperatives conduct their business much the same as other electric utilities. The Rural Electrification Administration, the National Rural Utilities Cooperative Finance Corporation, the Federal Financing Bank, and the Bank for Cooperatives are the most important sources of debt financing for electric cooperatives. There are approximately 960 electric cooperatives currently doing business in 46 States.

Power produced by federally owned utilities is not generated for profit. The goal of all Federal producers is to provide power at the lowest possible cost consistent with sound business principles, giving preference to publicly owned electric cooperative utilities in the sale of electricity. The U.S. Government is primarily a producer and wholesaler of electricity. These wholesale producers include the U.S. Army Corps of Engineers, the Bureaus of Indian Affairs and Reclamation within the U.S. Department of Interior, the Alaska Power Administration, the Tennessee Valley Authority, and the International Water and Boundary Commission within the U. S. Department of State. The Alaska Power Administration and the Tennessee Valley Authority market their own power. The electricity produced by other federally owned utilities is marketed

by the five power marketing administrations of the U.S. Department of Energy: Alaska, Bonneville, Southeastern, Southwestern, and Western Area.

Classes of Service (Sectors). In general, consumers are divided into classes or sectors based on the type of service they receive. The sectorial categorization of ultimate consumer is determined by the electric utility based on its service territory, size, location, ownership, and regulatory structure. The generic sectors (*residential, commercial, industrial, and other*) reflect the type of service consumers receive.

The residential sector includes electricity supplied to private household establishments and apartment buildings where energy is consumed primarily for space heating, water heating, air conditioning, lighting, refrigeration, cooking, and clothes drying. Electricity supplied for irrigation is sometimes included in this sector.

The commercial sector includes electricity supplied to nonmanufacturing business establishments, including hotels, motels, restaurants, wholesale businesses, and retail stores; and, health, social, and educational institutions. An electric utility may classify commercial service as all consumers whose demand or annual usage exceeds some specified limit. The limit may be set by the electric utility based on its rate schedule.

The industrial sector includes electricity supplied to manufacturing, construction, mining, agriculture, fishing, and forestry establishments -- Standard Industrial Classification (SIC) codes 1-39. An electric utility may classify industrial service using these SIC codes, or it may classify industrial service, based on demand or annual usage exceeding some specified limit. As in the commercial sector, the limit may be set by the electric utility based on its rate schedule.

The other sector includes public street and highway lighting, railroads and railways, municipalities, divisions or agencies of State and Federal governments under special contracts or agreements, and other utility departments, as defined by the pertinent regulatory agency and/or electric utility. This end-use sector, as well as all end-use sectors may be classified differently by each electric utility because of different rates, demand levels, and the economic activities of the consumers.

The Year at a Glance

In 1988, total sales of electricity to ultimate consumers (Table 1) were 2,578 thousand gigawatthours, a 5-percent increase from the 1987 sales of 2,457 thousand gigawatthours. Moderate economic growth and adverse weather conditions (cooler-than-normal temperatures during January, and warmer-than-normal temperatures during July and August) contributed to greater demand for electricity in 1988 than in 1987. The total output of industrial goods increased by 6 percent in 1988 compared with 1987, leading to a 5-percent or 38-thousand-gigawatthour increase in industrial sales. Sales of electricity to the residential sector in 1988 were 893 thousand gigawatthours, an increase of 5 percent. Additionally, sales of electricity to the commercial sector increased by 6 percent or 39 thousand gigawatthours.

The total revenue from sales of electricity for 1988 (Table 1) was 164 billion dollars, a 5-percent increase from 1987. Revenue for 1988 increased by 5 percent for the residential and commercial sectors and by 3 percent for the industrial sector from 1987. The average revenue per kilowatthour of electricity sold to ultimate consumers in the United States in 1988 was 6.35 cents (Table 2), representing a decrease of less than 1 percent from 1987. The average revenue per kilowatthour of electricity sold in the residential sector was 7.48 cents in 1988. Average revenue per kilowatthour sold in the commercial and industrial sectors for 1988 was 7.04 and 4.70 cents, respectively.

Among the ownership classes, privately owned electric utilities accounted for 77 percent (1,979 thousand gigawatthours) of total U.S. sales of electricity in 1988 (Table 4). Publicly owned electric utilities accounted for 14 percent, or 365 thousand gigawatthours; electric cooperative utilities accounted for 7 percent, or 183 thousand gigawatthours; and, federally owned electric utilities accounted for 2 percent, or 51 thousand gigawatthours, of total U.S. sales in 1988. All electric utility ownership classes reported increases in 1988 in

their sales of electricity to ultimate consumers from their 1987 sales (11 percent for federally owned electric utilities, 7 percent for electric cooperatives, 5 percent for publicly owned electric utilities, and 5 percent for privately owned electric utilities).

In 1988, federally owned electric utilities continued to have the lowest average revenue per kilowatthour of electricity sold at 3.84 cents, a 2-percent increase from 1987 (these utilities have no residential retail sales). Federally owned electric utilities generally have lower average revenue per kilowatthour because they are exempt from income tax, have access to lower interest loans, and use less expensive hydroelectric power. In addition, federally owned electric utilities set rates to recover only the cost of service and generally have no distinction between rates for wholesale and retail consumers. Average revenue per kilowatthour for publicly owned electric utilities was also lower than that of privately and cooperatively owned electric utilities. Publicly owned electric utilities have access to low-cost capital and are not allowed to charge a return for profit. Publicly owned electric utilities had an average revenue per kilowatthour of 5.69 cents in 1988, a 2-percent increase from 1987.

Privately owned electric utilities had an average revenue per kilowatthour of 6.49 cents in 1988, a 1-percent decrease from 1987. Although electric cooperatives have access to low-cost loans through the Rural Electrification Administration, they had the highest average revenue per kilowatthour at 6.84 cents in 1988, as well as in 1987. The higher average revenue per kilowatthour reflected by this ownership group may be attributable to the high cost of operating in remote rural areas having a low concentration of consumers.

In 1988, publicly owned electric utilities provided their residential consumers the lowest average revenue per kilowatthour of electricity sold of all the ownership classes. Average revenue per kilowatthour for publicly owned electric utilities in the residential sector was 16 percent below that for electric cooperatives and 21 percent below privately owned electric utilities (Table 2).

Table 1. Sales to Ultimate Consumers and Associated Revenue by Sector, 1988

Item	Residential	Commercial	Industrial	Other ¹	Total
Sales (gigawatthours)	892,866	699,100	896,498	89,598	2,578,062
Revenue (thousand dollars) ...	66,790,048	49,223,738	42,145,316	5,550,938	163,710,040

¹ Other includes public street and highway lighting, other sales to public authorities, sales to railroads and railways, and interdepartmental sales.

Notes: •The Form EIA-861 data shown in this publication differ somewhat from Form EIA-826, "Monthly Electric Sales and Revenue Report with State Distributions," estimated data published in the *Electric Power Monthly* and in the *Electric Power Annual* for 1987 and prior years. See Appendix C for a detailed description of these differences. •Totals may not equal sum of components because of independent rounding.

Sales, Revenue, and Average Revenue per Kilowatthour

This chapter provides summary statistics on the sale of electricity to ultimate consumers, the associated revenue, and average revenue per kilowatthour of electricity sold. This information is provided at the national, Census division, State, and electric utility levels.

Background

Electric power is an integral part of our way of life. It is indispensable to the factory, the commercial establishment, the home, and even most recreational facilities. The unavailability of electric power causes inconvenience to customers, loss of industrial production, as well as, danger to individuals and social disorder. Because electricity cannot be stored, it must be generated, transmitted to the consumer, and consumed instantaneously. Electric companies were formed to provide this service to all consumers in their territories at reasonable cost.

The service territory of an electric utility is geographically distinct and is usually composed of many different combinations of consumers. Electric utilities classify their consumers by different factors, such as demand, rate schedule, Standard Industrial Classification (SIC) code, distribution voltage, accounting methods, end-use applications, and other social and economic characteristics. Electric utilities use consumer classifications for planning (load growth, peak demands) and for determining their revenue requirements (cost of service), from which they base their rates.

Sales and Revenue

Revenue requirements are set to reimburse the electric utility for providing electric service. The revenue requirement is the anticipated cost of providing services for some period of time in the future, usually a year. Revenue requirements include investment depreciation, expenses for the production, transmission, and distribution systems, as well as sales costs, consumer costs, Federal and other taxes, and administration and general expenses. The revenue requirements also include an allowance for the profit of the electric utility, if applicable.

The process of determining electricity prices generally follows three stages: 1) revenue requirements are determined; 2) the revenue is allocated to different classes of service (sectors); and, 3) rate schedules for each sector are established. The cost of service to particular sectors and the mix of consumers served in the sectors provide guidelines for determining how much of the revenue must be collected from each sector. For example, the cost of service to the residential sector is usually higher than the cost to the commercial or industrial sectors because of the large number of consumers served, amount of distribution lines needed to provide the service, and the low consumption levels. The economic activity or type of business of the ultimate consumer is not necessarily the means by which electric utilities classify their consumers to determine revenue requirements and set rates. Electric utilities, in many instances, determine their revenue requirements and set their rates based on the level of demand and/or consumption of electricity.

The residential sector represents 88 percent of the total number of consumers, while accounting for only 35 percent of total sales of electricity. The industrial sector, which has an equal share of sales, accounts for 1 percent of the total number of consumers. The commercial sector, which represents 11 percent of the total number of consumers, accounts for 27 percent of total sales. The remaining share of sales is accounted for in the other sector. Privately owned electric utilities serve approximately three-fourths of the total number of ultimate consumers. Publicly owned electric utilities and electric cooperatives serve nearly all the remaining ultimate consumers as federally owned electric utilities have very few retail sales and sell almost exclusively to other electric utilities.

Rate Schedules. In general, the rate schedules for most electric utilities are designed to allow for operation, generation, maintenance, rental fees for equipment, and demand and service charges. Operation, generation, maintenance, and rental fees for equipment are usually fixed charges that are assessed monthly or annually. Demand charges are also fixed, but they vary with respect to volume of sales. A more detailed discussion of these charges is contained in the "Average Revenue per Kilowatthour" section of this chapter.

The rate schedules developed to generate revenue for electric utilities are unique to each utility. The rates reflect any number of considerations that are important to the economic welfare of the electric utility and may reflect other interests as well, such as rates that provide economic service to low-income families. The economic activity of the consumers and the rate schedule under which they are billed do not necessarily have a one-to-one correspondence. Generally billings are determined by the level of demand/consumption of electricity.

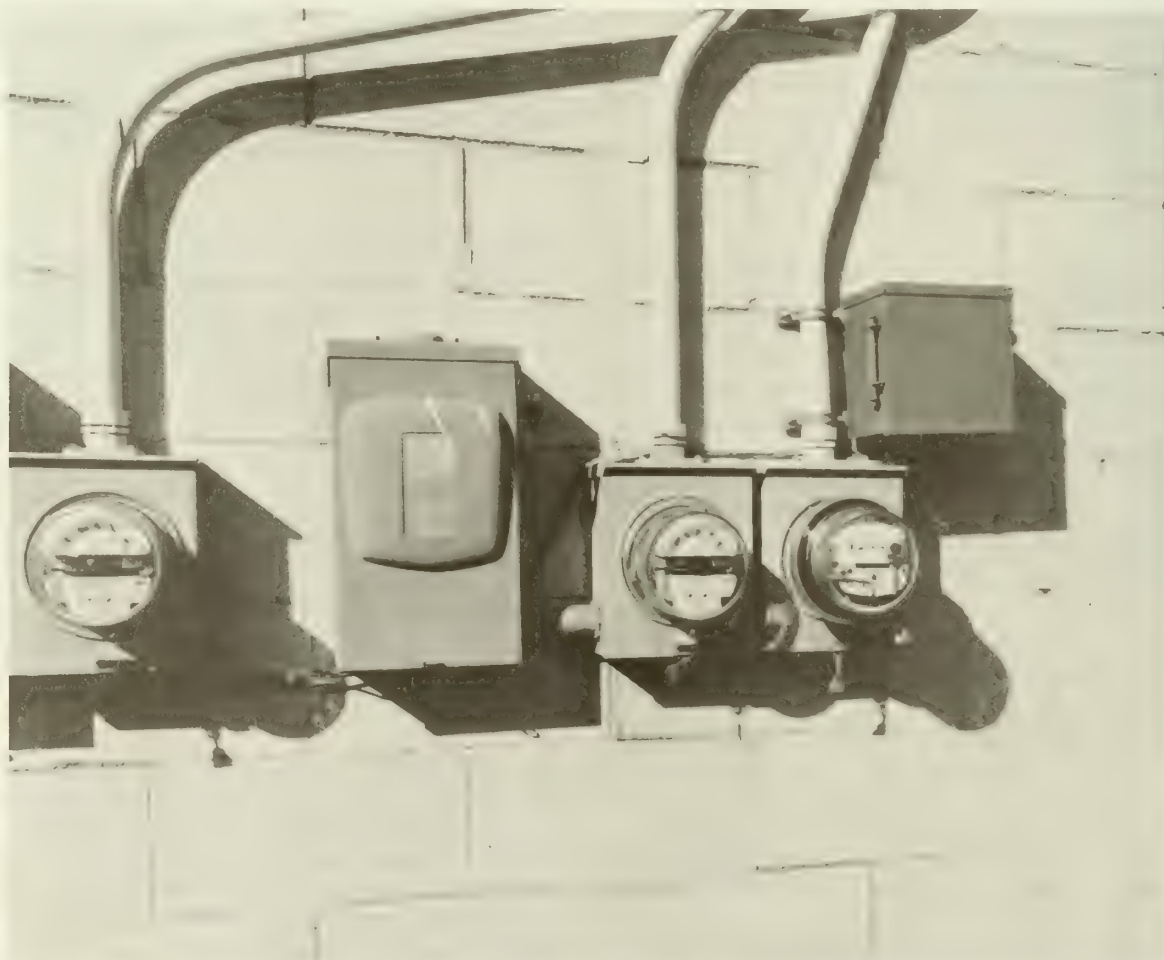

While commercial and industrial consumers billed according to a particular rate schedule will frequently be in the type of business indicated by that schedule, there are exceptions. A light manufacturing establishment with a manufacturing process that consumes little energy could be billed at a commercial rate because its consumption is not high enough to fall into the industrial schedule. A very large commercial building might have sufficiently large consumption to be billed at the industrial rate.

Sectorial classification of consumers may change over the course of a year as consumption varies. As a result, the rate schedule that would be applicable may vary. For example, a very large commercial building may

have a high level of consumption during the summer because of air conditioning equipment and thus would be billed at industrial rates. However, in the winter, if the building is heated by gas, consumption of electricity may decline and commercial rates may be applied for billing purposes rather than industrial rates.

The authority for the approval of these rates is based on the class of utility ownership. For example, privately owned (investor-owned) electric utilities are regulated by State public service commissions and the Federal Energy Regulatory Commission. Publicly owned electric utilities, in most States, are regulated by their consumer-owners through locally elected or appointed officials. A more detailed discussion on utility classes of ownership is contained in the "Introduction" section of the first chapter in this publication.

Data Sources. Tables 3 through 10 contain data on the retail sales of electricity, its associated revenue, and the average number of consumers at the national, Census and State levels by sector and class of utility ownership. Statistics contained in Tables 3 through 10 are based on data collected on the Form EIA-861, "Annual Electric Utility Report." Data for Puerto Rico are included only in Table 14, and not in the summary statistics.

A commercial electric meter with a remote transmitter/receiver unit, which relays information regarding consumption of electricity to a central control station.

Table 3. Sales to Ultimate Consumers and Associated Revenue by Sector, 1985-1988

Item	1988	1987	1986	1985

Average Revenue per Kilowatthour

Average Revenue per Kilowatthour at the National, Regional, and State Level. The average revenue per kilowatthour of electricity sold by sector and State is calculated by dividing total annual revenue by total annual retail sales for each sector and State. The average revenue per kilowatthour of electricity sold is the average cost for providing service to a sector given the rate schedule of the electric utility for that particular sector. Many rate schedules have a minimum service charge and most have a declining rate per unit of consumption as consumption increases. Rate schedules for commercial and industrial service almost always have a demand charge in addition to an energy charge. These factors lower the average revenue per kilowatthour as the average consumption increases.

Average revenue per kilowatthour from residential consumers is generally higher than for any other sector due in part to higher costs associated with serving many consumers who use relatively small amounts of electricity. These costs include direct-load costs (such as those for distribution lines, transformers, and meters) in addition to consumer or administrative costs. The industrial sector, which generally covers consumers with the highest use of electricity, has the lowest rates due to the economies of serving a few consumers who use relatively large amounts of electricity. Average residential revenue per kilowatthour has increased slightly while average commercial and industrial revenue per kilowatthour have decreased each year from 1985 through 1988. Some State utility commissions, during this period, have approved lower rates in the commercial and industrial sector in order to better represent the cost of service. In some instances, these lower rates were approved in order to stimulate use of electricity in the commercial and industrial sectors.

The federally owned electric utilities generally have the lowest average revenue per kilowatthour of the ownership classes because they have access to relatively low-cost financing and mostly utilize less expensive hydroelectric facilities. Because publicly owned electric utilities also have access to relatively low-cost financing and are nonprofit entities, they have lower average revenue per kilowatthour than privately owned electric utilities. Although electric cooperatives have economic advantages similar to those of the publicly owned utilities, they generally serve sparsely populated areas. As a consequence, electric cooperatives generally have higher average revenue per kilowatthour than do privately owned utilities.

Because of the type and availability of capacity and the cost of fuel, average revenue per kilowatthour of electricity sold differs across U. S. Census divisions. The New England and Middle Atlantic Census Divisions tend to have an average revenue per kilowatthour that is higher than average because of their reliance on petroleum, whereas the East and West South Central divisions rely on gas-fired generation and the East North Central and South Atlantic divisions rely on coal-fired generation. Petroleum is generally a more expensive energy source than coal and natural gas. Because the Mountain and Pacific Contiguous Census Divisions rely on less expensive hydroelectric generation, average revenue per kilowatthour in these regions is usually below the national average for all classes of consumers. The Census divisions where federally owned hydroelectric facilities provide electricity also tend to have lower average revenue per kilowatthour.

Tables 11 through 13 contain summary statistics on the average revenue per kilowatthour of electricity sold at the national, Census, and State level by sector and class of utility ownership. Data for Puerto Rico are included only in Table 14, and not in the summary statistics.

Notes: •The average revenue per kilowatthour of electricity sold is calculated by dividing revenue by sales. •The Form EIA-861 data shown in this publication differ somewhat from Form EIA-826, "Monthly Electric Sales and Revenue Report with State Distributions," estimated data published in the *Electric Power Monthly* and in the *Electric Power Annual* for 1987 and prior years. See Appendix C for a detailed description of these differences.

Source: Energy Information Administration, Form EIA-861, "Annual Electric Utility Report."

Average Revenue per Kilowatthour at the Electric Utility Level. The average revenue per kilowatthour of electricity sold for a utility is calculated in this report by dividing the total annual revenue of the electric utility by its total annual sales of electricity across all sectors. Because average revenue per kilowatthour varies between sectors, the difference in average revenue per kilowatthour between utilities may represent a difference in their proportion of sales in the different sectors. Accordingly, the average revenue per kilowatthour of electricity for a given utility does not reflect the differences that may exist in its revenue structure across sectors. The average revenue per kilowatthour of electricity at the utility level is usually between 4 and 10 cents; the average may be larger for a particular sector.

The majority of electric utilities in Alaska have average revenue per kilowatthour exceeding the U.S. average. This occurs in part due to the lack of economies of scale in Alaska and because the primary fuel source used in the State is natural gas.

Data on the number of consumers, revenue, sales, and average revenue per kilowatthour for selected electric utilities are contained in Table 14. Those electric utilities that provide residential service to communities with a population of 2,500 or more (the electric utilities for which electric bill data are presented in this publication) are included in Table 14. The average revenue per kilowatthour in Table 14 is based on an average for all end-use sectors. When an electric utility in Table 14 serves ultimate consumers in more than one State, that utility is listed under each State it serves. The electric utilities in Table 14 that serve ultimate consumers in more than one State and their percent of sales in each State are provided in Appendix A.

Data Sources. Statistics contained in Tables 11 through 14 are based on data collected on the Form EIA-861, "Annual Electric Utility Report." Data for Puerto Rico are included only in Table 14, and not in the summary statistics.

Around-the-clock operation is required in order that electric utilities may satisfy the needs of consumers of electricity.

¹ The number of ultimate consumers is the sum across all sectors of the average number of consumers at the close of each month.

² The average revenue per kilowatthour of electricity sold is calculated by dividing revenue by sales.

Notes: •Includes only those utilities that provide residential service to communities with a population of 2,500 or more. •Electric utilities serving consumers in more than one State are listed under each State served.

Source: Energy Information Administration, Form EIA-861, "Annual Electric Utility Report."

Monthly Bills

This chapter provides information on typical monthly bills to residential, commercial, and industrial consumers of electricity for service throughout the United States and Puerto Rico, with the exception of rural electric cooperatives. The Department of Agriculture, Rural Electrification Administration, collects similar information from cooperatively owned electric utilities. This information is presented at the electric utility level.

Background

The monthly electric bills provided in this chapter are the *typical net* bills based on the specific rate of each electric utility that is applicable to the largest number of the consumers at specified levels of demand (kilowatts) and consumption (kilowatthours). The rate schedules for each electric utility are generally approved by State public utility commissions (PUC). Rates are based on the allowable expenses, rate of return to shareholders' equity, and the rate base to which the return on equity can be applied. An electric utility may have a variety of rates under a given rate tariff, which is subject to change with PUC approval. These rates may vary not only among sectors but also within each sector. Rates may vary within sectors due to the type of service and the level of demand and/or consumption. The bills in this chapter are based on the rate tariff in effect on January 1, 1989.

The bills presented in this chapter are those that the electric utilities would have issued had their users consumed the amount of electricity specified in one month. Consequently the bills provided are *typical* rather than actual. They are also noninclusive, since they do not capture all consumption levels and rate schedules. Since the bills do not include certain taxes, such as sales taxes, they are considered *net* bills. Although the electric utilities sometimes act as collection agencies (that is, they collect certain taxes as part of their billing process), these monies are passed on to the appropriate taxation authorities. Monthly bills in this chapter represent rates at specific levels of consumption of electricity; and as a consequence, these data should not be used as a basis for deriving average revenue per kilowatthour of electricity sold. Average revenue per kilowatthour is provided in the second chapter of this report.

Tables 15, 16, and 17 contain a code in the Bill Code column that cross references the bills for a specific utility with the communities (Appendix B) located within their service areas. These codes are based on the two-digit FIPS State Code (the first two letters of the bill code); a three-digit sequential numeric code; and finally, in the case of residential and commercial bills, a single-digit code indicating the sector (R for residential or C for commercial). No code is used for the industrial sector. For example, bills for the Alabama Power Company (the first utility listed in Tables 15, 16, and 17) have the following bill codes: AL001R (residential), AL001C (commercial), and AL001 (industrial). The communities represented by the specified bills are provided in Appendix B.

In addition to the Bill Code, Tables 15 through 17 contain a Season Code. This code represents the utility-specific seasonal rates used to derive the bills. Winter, summer, and annual rates are indicated by a code of 1, 2, and 3, respectively.

Residential Bills

Monthly bill data for the residential sector (Table 15) are collected from all electric utilities (excluding rural electric cooperatives) that provide residential service in communities with a population of 2,500 or more based on the *1980 Census of Population*, the Bureau of the Census, U.S. Department of Commerce. In 1989, bill data were collected from 7,523 communities representing 67 percent of the 1980 U.S. population (229,742,325) including Puerto Rico. Additional information on the communities served is contained in Appendix B. Information on monthly residential bills was collected from 225 privately owned and 1,043 publicly owned electric utilities including multi-State operations in 1989. In addition, monthly bills for residential service were collected from the Commonwealth of Puerto Rico. Puerto Rico is served by one publicly owned electric utility.

In the residential sector, information on monthly bills is collected for 5 levels of consumption. These consumption levels (in kilowatthours) are 250, 500, 750, 1,000, and 2,500. Each level of consumption represents general household uses of electricity. For example, the 250- and 500-kilowatthour levels of consumption are indicative of households that use electricity for lighting and for appliances (such as refrigerators and kitchen

stoves). In addition to those uses, the 750- and 1,000-kilowatthour levels generally include households that use electric water heaters. Households that use electricity for space heating and/or air conditioning, as well as those uses reflected by the lower levels of consumption specified, are included in the 2,500-kilowatthour level of consumption. The uses specified are not exclusive at the levels indicated; instead, they are representations of *typical* usage of electricity in the residential sector.

Residential rate schedules customarily do not include charges for demand in addition to consumption. Demand describes the rate at which power (electricity) is drawn while consumption describes the quantity of power drawn. Demand charges are normally not present in residential rates because utilities can accommodate the loads placed on their systems by household appliances with little difficulty.

While commercial and industrial consumers billed according to a particular rate schedule will frequently be in the type of business indicated by that schedule, there are exceptions. A light manufacturing establishment with a manufacturing process that consumes little energy could be billed at a commercial rate because its consumption is not high enough to fall into the industrial schedule. A very large commercial building might have sufficiently large consumption to be billed at the industrial rate. Sectorial classification of consumers may change over the course of a year as consumption varies; and as a result, the rate schedule that would be applicable may vary. For example, a very large commercial building may have a high level of consumption during the summer because of air conditioning equipment and thus would be billed at industrial rates. However, in the winter, if the building is heated by gas, consumption of electricity may decline and commercial rates may be applied for billing purposes rather than industrial rates. A more detailed discussion of this subject is contained in the second chapter of this report.

Commercial Bills

Monthly bill data for the commercial sector (Table 16) are collected from all electric utilities (excluding rural electric cooperatives) that provide commercial service in communities with a population of 50,000 or more based on the *1980 Census of Population*, the Bureau of the Census, U.S. Department of Commerce. In those States that do not have 3 communities with a population of 50,000 or more, data are collected regarding the 3 largest communities. Information on these communities is contained in Appendix B. Commercial bill data were collected from 203 electric utilities serving 491 communities representing a population of 80,573,145. Data on monthly commercial bills were collected from 135 privately owned and 68 publicly owned electric utilities including multi-State operations in 1989. In ad-

dition, monthly bills for commercial service were collected from the Commonwealth of Puerto Rico.

In the commercial sector, information on monthly bills is collected for 6 levels of demand and consumption. The 6 levels of demand/consumption are as follows:

- 6 kilowatts / 750 kilowatthours
- 12 kilowatts / 1,500 kilowatthours
- 30 kilowatts / 6,000 kilowatthours
- 40 kilowatts / 10,000 kilowatthours
- 50 kilowatts / 12,500 kilowatthours
- 100 kilowatts / 30,000 kilowatthours

The levels of demand/consumption specified for commercial service are representative of many, but not all commercial environments in which electric utilities provide service.

Industrial Bills

Monthly bill data for the industrial sector (Table 17) are collected from all electric utilities (excluding rural electric cooperatives) that provide industrial service in communities with a population of 50,000 or more based on the *1980 Census of Population*, the Bureau of the Census, U.S. Department of Commerce. In those States that do not have 3 communities with a population of 50,000 or more, data are collected regarding the 3 largest communities. Additional information on these communities is contained in Appendix B. In 1989, data on monthly industrial bills were collected from 203 electric utilities that served 491 communities representing a population of 80,573,145. Of those electric utilities, 135 are privately owned and 68 are publicly owned (including multi-State operations). The Commonwealth of Puerto Rico is included in the publicly owned electric utilities.

Industrial electric service differs from residential and commercial service because of the amount and rate at which power is consumed by the user. As load and consumption increases, more complex components of cost are included in the bill-calculation process. For instance, for industrial service, various discounts or penalties (for example, power factor adjustments) are factored into the computation of monthly bills, that are not applicable for lower levels of demand/consumption. In the industrial sector, information on monthly bills is collected for 10 levels of demand and consumption. The 10 levels of demand/consumption are as follows:

- 150 kilowatts / 30 megawatthours
- 150 kilowatts / 60 megawatthours
- 300 kilowatts / 60 megawatthours
- 300 kilowatts / 120 megawatthours
- 500 kilowatts / 100 megawatthours
- 500 kilowatts / 200 megawatthours
- 1,000 kilowatts / 200 megawatthours
- 1,000 kilowatts / 400 megawatthours

- 5,000 kilowatts / 1,500 megawatthours
- 5,000 kilowatts / 2,500 megawatthours

The levels of demand/consumption specified for industrial service are representative of many, but not all industrial environments in which electric utilities provide service.

Data Sources

Statistics on monthly electric bills at the utility level for the residential, commercial, and industrial sectors contained in Tables 15 through 17 are based on data collected on the Form EIA-213, "Typical Net Monthly Bills." Information regarding the communities is based on the *1980 Census of Population*. More detailed information on these communities is contained in Appendix B. Information related to communities in which more than one electric utility provides service is also contained in Appendix B.

¹ Used to cross-reference the communities listed in Table B1 to the bills listed in this table.

² The utility specified winter, summer, and annual rates are indicated by a code of 1, 2, and 3, respectively.

³ The utility did not respond by publication date. Data from the prior year were used.

⁴ Bills for Consolidated Edison of New York reflect a 6.85 percent gross receipts tax that was not included in the calculations for prior years.

kWh = Kilowatthour.

Note: Based on rates effective January 1, 1989.

Source: Energy Information Administration, Form EIA-213, "Typical Net Monthly Bills."

¹ Used to cross-reference the communities listed in Table B1 to the bills listed in this table.

² The utility specified winter, summer, and annual rates are indicated by a code of 1, 2, and 3, respectively.

³ Level of demand is shown in kilowatts and consumption is shown in kilowatthours.

⁴ The utility did not respond by publication date. Data from the prior year were used.

⁵ Bills for Consolidated Edison of New York reflect a 6.85 percent gross receipts tax that was not included in the calculations for prior years.

kW = Kilowatt.

kWh = Kilowatthour.

Note: Based on rates effective January 1, 1989.

Source: Energy Information Administration, Form EIA-213, "Typical Net Monthly Bills."

¹ Number of communities served.

² Used to cross-reference the communities listed in Table B1 to the bills listed in this table.

³ The utility specified winter, summer, and annual rates are indicated by a code of 1, 2, and 3, respectively.

⁴ Level of demand is shown in kilowatts and consumption is shown in megawatthours.

⁵ The utility did not respond by publication date. Data from the prior year were used.

⁶ Bills for Consolidated Edison of New York reflect a 6.85 percent gross receipts tax that was not included in the calculations for prior years.

MWh = Megawatthour.

kW = Kilowatt.

Note: Based on rates effective January 1, 1989.

Source: Energy Information Administration, Form EIA-213, "Typical Net Monthly Bills."

State**

Electric Utilities Serving Ultimate Consumers in More Than One State

This appendix contains information from the Form EIA-861, "Annual Electric Utility Report," regarding electric utilities that provide residential service in communities with a population of 2,500 or more and that serve ultimate consumers in more than one State (Table A1). Additionally, the percent of sales of electricity in each State served is included in Table A1. The information can be used as a reference to Table 14. For example, information contained in Table A1 indicates that the Appalachian Power Company serves consumers in the States of Virginia and West Virginia. Table 14 contains the respective sales, revenue, and average

revenue per kilowatthour of electricity sold for this electric utility in both States.

The majority of utilities that serve ultimate consumers in more than one State are the investor-owned (privately owned) electric utilities. Privately owned utilities generally have large franchise service areas and historically have served in more than one State. Public utilities usually are chartered by municipal or State governments and usually only serve within the cities or counties where they are located.

Appendix B

Communities Represented by the Electric Bills

Communities Represented by the Electric Bills

This appendix contains a list of the communities for which the electric utilities surveyed by the Form EIA-213, "Typical Net Monthly Bills," submit bill data. Information pertaining to communities and population is based on the *1980 Census of Population*, the Bureau of the Census (Census), U.S. Department of Commerce.

Background

A community is defined in this publication as either an incorporated place (*place*) or as a Census Designated Place (*CDP*) with a population of 2,500 or more. A place has been incorporated under the laws of its State as a city, borough, town, or village. Exceptions to this rule are Alaska and New York, where boroughs are not considered by the Census to be places, and New York, Wisconsin, and the six New England States, where towns are not considered by the Census to be places. Many of these boroughs and towns, however, are counted by the Census as CDP's.

The definition of a CDP is established by the Census and varies by State. The Census uses CDP's to identify heavily populated areas that are not incorporated. The Census, however, generally does not establish a CDP unless an area has a population of 1,000 or more and a population density of 1,000 or more persons per square mile. While the boundary of a place is set by the State, the boundary of a CDP is set by the Census and can change as settlement patterns change over time. The Census does not use either place or CDP designations for the Commonwealth of Puerto Rico. Puerto Rico is treated as a place on the Form EIA-213 because a single electric utility serves the entire island and it is not an incorporated entity.

Communities Related to Bill Data

Information contained in Table B1 provides a cross reference between the communities served by the electric utilities surveyed on the Form EIA-213 and the bills provided in Tables 15 through 17 in the third chapter in this report. The bill codes in this table are based on the two-digit FIPS State code (the first two letters of the bill code); a three-digit sequential numer-

ical code; and finally, a single-digit letter code indicating sector (R for residential, C for commercial, and no code for industrial). For example, the City of Abbeville, Alabama in Table B1 is associated with the code, AL001R. In order to identify the bills and the electric utility that correspond with that code, see Table 15 (residential) and refer to Bill Code AL001R listed under the State of Alabama.

Communities Served by More Than One Electric Utility

In some communities in the United States, more than one utility provides electricity. For those communities where more than one electric utility provides electric service, the share of total service in the community is based on the number of customers, rather than the population of the community (Table B2).

While electric utilities may serve the same community, they are generally not in direct competition. That is, the consumer does not usually have the option to select the utility from which to purchase electricity. Consumers, particularly those in the industrial and commercial sectors, however, can decide to locate in the service area of a given electric utility. Thus, consumers can indirectly affect the rates established by electric utilities. In addition, the consumer may take part in the rate-setting process. By being aware of events occurring that determine the rates (charges), which a given utility is allowed to use, the consumer can make the rate-making authorities aware of their preferences.

Residential. A total of 107 communities are provided residential electric service by more than one utility. For example, in the community of Parkland, Washington, 3 utilities serve the residential sector. The Elmhurst Mutual Power and Light Company serves approximately 58 percent of the consumers; the Parkland Light and Water Company, approximately 26 percent; and the City of Tacoma, approximately 15 percent.

Commercial. A total of 23 communities received commercial electric service from 2 or more electric utilities. For example, Glendale, Arizona, is served by 2 electric utilities. The Arizona Public Service Company provides commercial electric service to 35 percent of the

community and the Salt River Project provides 65 percent.

Industrial. Two or more electric utilities provide electricity for industrial uses in 23 communities. For example, in the community of Norwalk, Connecticut, 3 utilities serve the industrial sector. The Connecticut Light and Power Company serves 56 percent of the consumers; the Norwalk Third Taxing District, 18 percent; and the South Norwalk Electric Works, 26 percent.

States With Fewer Than Three Qualifying Communities

In the sections of this publication that apply to commercial and industrial electric service, information on typical net monthly bills is based on communities with a population of 50,000 or more according to the 1980 Census. However, 15 States have fewer than 3 communities with a population that meets the threshold (Table B3).

* Value less than 0.5 Percent.

NA = In this sector, the community is served by one utility.

CDP = Census Designated Place.

Note: Totals may not equal sum of components because of independent rounding.

Technical Notes

Technical Notes

Sources of Data

The *Electric Sales, Revenue, and Bills (ESRB)* is prepared by the Electric Power Division, Office of Coal, Nuclear, Electric and Alternate Fuels (CNEAF), Energy Information Administration (EIA), U.S. Department of Energy. Data published in the *ESRB* are com-

piled from two EIA statistical forms: the Form EIA-861, "Annual Electric Utility Report," and the Form EIA-213, "Typical Net Monthly Bills." Data on the communities served are based on the *1980 Census of Population*, the Bureau of the Census (Census), U. S. Department of Commerce. The coverage of the two forms is provided in Table C1. A brief summary of the EIA forms is presented below.

Table C1. Electric Utilities Included in the Survey Universes

Class of Ownership	Form EIA-861	Form EIA-213
Private	271	225
Public	¹ 1,997	² 1,044
Cooperative	959	NA
Federal	10	0
Total	3,237	1,269

¹ Data for Puerto Rico are included in Table 14 only, and not in the summary statistics.

² Includes The Puerto Rico Electric Power Authority.

NA = Data for electric cooperatives are not collected on the Form EIA-213, "Typical Net Monthly Bills."

Sources: Energy Information Administration, Form EIA-861, "Annual Electric Utility Report," and Form EIA-213, "Typical Net Monthly Bills."

Form EIA-861

The Form EIA-861 is a mandatory census of electric utilities in the United States. The survey collects information on power production and sales data from approximately 3,250 electric utilities. The data collected are used to maintain and update the electric utility frame data base of the EIA. This data base supports queries from the Executive Branch, Congress, other public agencies, and the general public. Summary data from the Form EIA-861 are also contained in the *Electric Power Monthly*, the *Electric Power Annual*, the *Financial Statistics of Selected Electric Utilities*, and the *Annual Outlook for U.S. Electric Power*. These reports present aggregate totals for electric utilities at the national, regional, and State level by consumer classes. Data for the four power authorities of the Virgin Islands, American Samoa, Guam, and Puerto Rico are included only in the detailed tables, and not in the summary statistics.

Instrument and Design History. The Form EIA-861 was implemented in January 1985 to collect data as of

year-end 1984. The Federal Energy Administration Act of 1974 (Public Law 93-275) defines the legislative authority to collect these data.

Data Processing. The Form EIA-861 is mailed to the respondents in February to collect data as of the end of the preceding calendar year. The completed forms are to be returned to the EIA by May 1. The data are manually edited before being entered into the interactive on-line system. Internal edit checks are performed to verify that current data total across and between schedules, and are comparable to data reported the previous year. Edit checks are also performed to compare data reported on the Form EIA-861 with similar data reported on the Forms EIA-826, EIA-412, and Federal Energy Regulatory Commission Form 1. Respondents are telephoned to obtain clarification of reported data or to obtain missing data.

Form EIA-861 figures shown in this publication differ somewhat from the sum of the monthly Form EIA-826 figures for sales published in the *Electric Power Monthly* and in the *Electric Power Annual* for 1987 and prior

years. Both forms use sectoral classifications (residential, commercial, and industrial) based on the usual classification of consumers by the utilities. The sectoral classification scheme for electricity sales can vary from utility to utility, as influenced by the local public utility commission. At the national level, the Form EIA-861 and Form EIA-826 figures corresponded closely (within 3 percent) for all end-use sectors. Some larger differences were observed at the State level particularly for Tennessee due to a misclassification of commercial and industrial data in the Form EIA-826 survey.

Differences between the Form EIA-861 and Form EIA-826 figures can result from the Form EIA-826 sampling procedure and/or from nonsampling error in either data collection. One source of nonsampling error in the Form EIA-826 stems from the practice of filing estimates for monthly sales and revenue when the actual figures are not yet available. Although respondents are instructed to file revisions, revisions are not always filed. The respondents are instructed to review their Form EIA-826 figures at the end of the reporting year to ensure consistency with Form EIA-861 figures. Survey analysts at the EIA compare these data series and attempt to resolve any differences. Nevertheless, some reporting differences remain.

Form EIA-213

The Form EIA-213 is a voluntary annual survey of electric utilities in the United States and Puerto Rico (except for rural electric cooperatives). The form collects information on monthly electric bills for residential, commercial, and industrial electric service. The bills provided in this report, based on the Form EIA-213, represent *typical net* monthly electric bills reported by electric utilities based on the specific rate in effect on January 1, 1989, that is applicable to the majority of their consumers at specific levels of demand (kilowatts) and consumption (kilowatthours). These bills are those that the electric utilities would have issued had their customers consumed the specified amount of electricity. Consequently, bills in this report are *typical* rather than actual. They are also not all-inclusive, since they do not capture all consumption levels and rate schedules. Since the bills do not include some taxes, they are *net* bills.

Electric utility rate schedules are generally approved by State public utility commissions (PUC). The PUC determines the allowable expenses, rate of return to shareholder's equity, and the rate base to which the rate of return can be applied. An electric utility may have a variety of rates under a given rate tariff, which is subject to change with PUC approval. The bills provided in this report are based on the rate tariff in effect on January 1, 1989.

Typical monthly bills for residential electric service (at 5 specific levels of consumption) are collected for

each community with a population of 2,500 or more. Typical monthly bills for commercial (at 6 specific levels of demand/consumption) and for industrial electric service (at 10 specific levels of demand/consumption) are collected for each community with a population of 50,000 or more (for States with less than 3 communities of that size, data are collected for the 3 largest communities).

The specific demand/consumption levels used on the Form EIA-213 were established in 1934 under the advice of industry experts. In 1980, the demand/consumption levels were evaluated to determine if they reasonably represented existing consumer usage of electricity. It was determined, based on the evaluation, that no changes were needed for the commercial and industrial demand/consumption levels, which represent small-to-medium size establishments. However, the evaluation of 1980 residential usage of electricity revealed patterns that indicated the specific consumption levels in this sector should be modified. The 100-kilowatthour consumption level was deemed to be too low and, therefore, was eliminated. Conversely, a 2,500-kilowatthour level of consumption was added to accommodate all-electric homes. Additionally, it was determined that homes with hot-water heaters would be reflected better at the 750- and 1,000-kilowatthour consumption levels instead of at the 500- and 750-kilowatthour consumption levels.

In 1989, monthly electric bills were collected from 1,269 electric utilities (counting multi-State operations). This included 225 privately owned and 1,044 publicly owned utilities. These utilities provided residential electric service to 7,523 communities with a population of 2,500 or more based on the *1980 Census of Population*. In addition, monthly bills were collected from those utilities (203) that also provided commercial and industrial electric service to communities with a population of 50,000 or more. This group included 135 privately owned and 68 publicly owned utilities. In those States with less than 3 communities with a population of 50,000 or more, monthly bills for commercial and industrial electric service are collected for the 3 largest communities. Fifteen States have less than 3 communities with a population of 50,000 or more (See Table B3 in Appendix B).

Data collected on the Form EIA-213 are used to update the Form EIA-213 system data base. This data base supports queries from the Executive Branch, Congress, other public agencies, and the general public.

The reader is cautioned against using the bills in this report to derive average revenue per kilowatthour (bill divided by consumption level). The rates determined from these bills are valid only for a narrow range around each consumption level. In fact, the size of the band varies with each utility. No study has been done to identify the size of these bands.

Instrument and Design History. The Federal Power Commission (FPC) implemented the FPC Form 3 in 1934. The EIA assumed responsibility for the form in October 1977 when the FPC merged with the Department of Energy. Except for minor revisions, data reported on the Form EIA-213 are the same as those collected by FPC Form 3, which expired on June 30, 1979. The form contains 3 schedules (residential, commercial, and industrial electric service). The Federal Energy Administration Act of 1974 (Public Law 93-275) defines the legislative authority to collect these data.

Data Processing. Using a computerized address file, the forms are mailed to respondents by the last working day in December. Prior-year data are preprinted on the forms, and respondents are requested to make any necessary adjustments. Completed forms are to be returned to the EIA by the 45th working day after January 1 of the reporting year. Followup letters citing the failure to file the Form EIA-213 are mailed to all nonrespondents. If no response occurs as a result of the followup letters, the respondent utilities are contacted by telephone to obtain the requested data. Every effort is made to work with each utility to obtain the data; however, the form is voluntary. If data for the current year cannot be obtained, data from the prior year are published, since no other EIA forms are filed that would provide data for use in calculating a more statistically correct bill. When this occurs, it is footnoted.

Upon receipt at CNEAF, the forms are logged in and manually edited prior to being entered into the Form EIA-213 system data base. The Form EIA-213 system contains automated edits that include both deterministic checks, in which records are checked for the presence of required fields and their validity, and statistical checks, in which estimation techniques are used to validate data according to past behavior of the data and in comparison to other fields. When all data have passed the edit process, the system builds master files. These master files are used as input to programs designed to calculate the average electric bill for each utility at specific consumption levels for residential service, and specific demand and consumption levels for commercial and industrial service. Following verification, tables and text of the data are produced for inclusion in the *ESRB*. After the *ESRB* receives clearance from the EIA, the data are made available for public use on a cost-recovery basis.

Quality of Data

The CNEAF office is responsible for routine data improvement and quality assurance activities. All operations in this office are done in accordance with formal

standards established by the EIA. These standards are the measuring rod necessary for quality statistics. Data improvement efforts include verification of data-keyed input by automatic computerized methods, editing by subject matter specialists, and followup on nonrespondents. The CNEAF office supports the quality assurance efforts of the data collectors by providing advisory reviews of the structure of information requirements and of proposed designs for new and revised data collection forms and systems. Once implemented, the actual performance of working data collection systems is also validated. Computerized respondent data files are checked to identify those who fail to respond to the survey. By law, nonrespondents may be fined or otherwise penalized for not filing a mandatory EIA data form. Before invoking the law, the EIA tries to obtain the required information by encouraging cooperation of nonrespondents.

Completed forms received by the CNEAF office are sorted, screened for completeness of reported information, and keyed onto computer tapes for storage and transfer to random access data bases for computer processing. The information coded on the computer tapes is manually spot-checked against the forms to certify accuracy of the tapes. To ensure the quality standards established by the EIA, formulas that use the past history of data values in the data base have been designed and implemented to automatically check data input for errors. Data values that fall outside the ranges prescribed in the formulas are verified by telephoning respondents to resolve any discrepancies.

Data Editing System

Data from the Form EIA-861 and Form EIA-213 are edited on an annual basis using automated systems. The edits include both deterministic checks, in which records are checked for the presence of required fields and their validity, and statistical checks, in which estimation techniques are used to validate data according to their behavior in the past and in comparison to other current fields.

Confidentiality of the Data

The data collected on the forms used for input to this report are not confidential.

Formulas

Average Revenue per Kilowatthour. The average revenue per kilowatthour of electricity sold is calculated by dividing total annual revenue by total annual sales of electricity.

Rounding Rules for Data

Given a number with r digits to the left of the decimal and $d+t$ digits in the fraction part, with d being the place to which the number is to be rounded and t being the remaining digits that will be truncated, this number is rounded to $r+d$ digits by adding 5 to the $(r+d+1)$ th digit when the number is positive or by subtracting 5 when the number is negative. The t digits are then truncated at the $(r+d+1)$ th digit. The symbol for a rounded number truncated to zero is (*).

Data Correction Procedure

The CNEAF office has adopted the following policy with respect to the revision and correction of data published in energy data reports and made available in a machine format:

- Publication of these data results in their finalization at which point the data base is closed.
- Revisions or corrections are made only in the event a substantial (greater than 1 percent) reporting change is received or a substantial (greater than 1 percent) error is discovered.
- No revisions will be made without the approval of the Director, Electric Power Division.

Obtaining Copies of Data

Upon EIA approval of the *ESRB*, the data become available for public use on a cost-recovery basis. Computer listings may be obtained by submitting a written request to:

Energy Information Administration, EI-541
Forrestal Building
U.S. Department of Energy
Washington, DC 20585

These data are also available on machine-readable tapes. Tapes may be purchased by using Visa, Master Card, or American Express cards, as well as money orders or checks payable to the National Technical Information Service (NTIS). Purchasers may also use NTIS and Government Printing Office depository accounts. To place an order, contact:

National Technical Information Service (NTIS)
Office of Data Base Services
U.S. Department of Commerce
5285 Port Royal Road
Springfield, Virginia 22161

Glossary

Base Bill: A charge calculated by taking the rate from the appropriate electric rate schedule and applying it to the level of consumption.

Base Rate: A fixed per kilowatthour charge for electricity consumed that is independent of other charges and/or adjustments.

Block Rate Schedule: An electric rate schedule with a provision for charging a different unit cost for various increasing blocks of demand or energy. Usually a reduced price is charged on succeeding blocks.

Census Divisions: The nine geographic divisions of the United States established by the Bureau of the Census, U.S. Department of Commerce for statistical analysis. The boundaries of Census divisions coincide with State boundaries. The Pacific Division is subdivided into the Pacific Contiguous and Pacific Noncontiguous areas.

Classes of Service: Consumers grouped by similar characteristics in order to be identified for the purpose of setting a common rate for electric service. Usually classified into groups identified as residential, commercial, industrial and other.

Class Rate Schedule: An electric rate schedule applicable to one or more specified classes of service, groups of businesses, or customer uses.

Commercial Sector: The commercial sector is generally defined as nonmanufacturing business establishments, including hotels, motels, restaurants, wholesale businesses, retail stores, and health, social, and educational institutions. Electric utilities may classify commercial service as service that includes all consumers whose demand or annual use exceeds some specified limit. The limit may be set by the utility based on the rate schedule of the utility. Consumers (i.e. farms and irrigation) that the utility has no system for separating into residential, commercial, and industrial classifica-

tions, should be classified based on the schedule they most closely resemble. If there is no rate schedule distinction, utilities may define commercial consumers as those having a demand of less than 1000 kilowatts.

Consumer Charge: An amount charged periodically to a consumer for such utility costs as billing and meter reading, without regard to demand or energy consumption.

Cooperative (Cooperatively Owned Electric Utility): A group organized under the law into a utility company that will generate, transmit, and/or distribute supplies of electric energy to a specified area not being serviced by another utility. Such ventures are generally exempt from the Federal income tax laws. Most electric cooperatives have initially been financed by the Rural Electrification Administration, U.S. Department of Agriculture.

Cost of Service: A ratemaking concept used for the design and development of rate schedules to ensure that the filed rate schedules recover only the cost of providing the electric service at issue. These costs include operating and maintenance expenses, depreciation and amortization expenses, and income and other taxes found just and reasonable by the regulatory agency for ratemaking purposes plus, in the case of privately owned electric utilities, an allowance for a return on capital (usually computed by applying a rate of return to the rate base). This concept attempts to equate the cost incurred by the utility to the revenue received for the service provided to each of the consumer classes.

Demand (Electric): The rate at which electric energy is delivered to or by a system, part of a system, or piece of equipment, at a given instant or averaged over any designated period of time.

Demand Charge: That portion of the consumer's bill for electric service based on the consumer's maximum electric capacity usage and calculated based on the

billing demand charges under the applicable rate schedule.

Energy Information Administration (EIA): An independent agency within the U.S. Department of Energy that develops surveys, collects energy data, and does analytical and modeling analysis of energy issues. The Agency must meet the requests of Congress, other elements within the Department of Energy, Federal Energy Regulatory Commission, the Executive Branch, its own independent needs, and assist the general public, or other interest groups, without taking a policy position.

Economy of Scale: The principle that larger production facilities have lower unit costs than smaller facilities.

Electric Power Industry: The privately, publicly, federally and cooperatively owned electric utilities of the United States taken as a whole. This includes all electric systems serving the public: regulated investor-owned electric utility companies; Federal power projects; State, municipal, and other government-owned systems, including electric public utility districts; electric cooperatives, including generation and transmission entities. Excluded from this definition are the special purpose electric facilities or systems that do not offer service to the public.

Electric Rate: The price set for a specified amount of electricity in an electric rate schedule or sales contract.

Electric Rate Schedule: A statement of the electric rate and the terms and conditions governing its application, including attendant contract terms and conditions that have been accepted by a regulatory body with appropriate oversight authority.

Electric Utility: An enterprise that is engaged in the generation, transmission, or distribution of electric energy primarily for use by the public and that is the major power supplier within a designated service area. Electric utilities include privately owned, publicly owned, cooperatively owned, and government-owned (municipals, Federal agencies, State projects, and public power districts) systems.

Energy: The capacity for doing work as measured by the capability of doing work (potential energy) or the conversion of this capability to motion (kinetic en-

ergy). Energy has several forms, some of which are easily convertible and can be changed to another form useful for work. Most of the world's convertible energy comes from fossil fuels that are burned to produce heat that is then used as a transfer medium to mechanical or other means in order to accomplish tasks. Electrical energy is usually measured in kilowatthours, while heat energy is usually measured in British thermal units.

Federal Energy Regulatory Commission (FERC): A quasi-independent regulatory agency within the Department of Energy having jurisdiction over interstate electricity sales, wholesale electric rates, hydroelectric licensing, natural gas pricing, oil pipeline rates, and gas pipeline certification.

Flat and Meter Rate Schedule: An electric rate schedule consisting of two components, the first of which is a service charge, and the second a price for the energy consumed.

Flat Demand Rate Schedule: An electric rate schedule based on billing demand that provides no charge for energy.

Gigawatt (GW): One billion watts.

Gigawatthour (GWh): One billion watthours.

Industrial Sector: The industrial sector is generally defined as including manufacturing, construction, mining, agriculture, fishing, and forestry establishments under Standard Industrial Classification (SIC) codes 01-39. The utility may classify industrial service using the SIC codes, or based on demand or annual usage exceeding some specified limit. The limit may be set by the utility based on its own rate schedule. Sales for consumers (i.e. farms and irrigation) that the utility has no system for separating into residential, commercial, and industrial classifications, should be classified based on the classification of their rate most closely resembles. If there is no rate schedule distinction, utilities may define industrial consumers as those having a demand equal to or greater than 1,000 kilowatts.

Interdepartmental Sales: Includes amounts charged by the electric department at tariff or other specified rates for electricity supplied by it to other utility departments.

Kilowatt (kW): One thousand watts.

Kilowatthour (kWh): One thousand watthours.

Megawatt (MW): One million watts.

Megawatthour (MWh): One million watthours.

Other Sector: Electricity supplied to public street and highway lighting, other service to public authorities, service to railroads and railways, and interdepartmental service.

Power (Electrical): An electric measurement unit of power called a voltampere is equal to the product of 1 volt and 1 ampere. This is equivalent to 1 Watt for a direct current system and a unit of apparent power is separated into real and reactive power. Real power is the work-producing part of apparent power that measures the rate of supply of energy and is denoted as kilowatts (KW). Reactive power is the portion of apparent power that does no work and is referred to as kilovars; this type of power must be supplied to most types of magnetic equipment, such as motors, and is supplied by generator or by electrostatic equipment. Voltamperes are usually divided by 1,000 and called kilovoltamperes (kVA). Energy is denoted by the product of real power and the length of time utilized; this product is expressed as kilowatthours.

Privately Owned Electric Utility: A class of utility that is investor owned and organized as a tax paying business, usually financed by the sales of securities in the capital market.

Public Authorities: Electricity supplied to municipalities or divisions or agencies of State and Federal governments, usually under special contracts or agreements that are applicable only to public authorities.

Public Street and Highway Lighting Service: Electricity supplied and services rendered for the purpose of lighting streets, highways, parks, and other public places; or for traffic or other signal system service, for municipalities, or other divisions or agencies of State or Federal governments.

Publicly Owned Electric Utility: A class of utility that includes those utilities operated by municipalities, po-

litical subdivisions, utility or power districts, and State and Federal power agencies.

Railroad and Railway Electric Service: Electricity supplied to railroads and interurban and street railways, for general railroad use, including the propulsion of cars or locomotives, where such electricity is supplied under separate and distinct rate schedules.

Rate Base: The value of property upon which a utility is permitted to earn a specified rate of return as established by a regulatory authority. The rate base generally represents the value of property used by the utility in providing service and may be calculated by any one or a combination of the following accounting methods: fair value, prudent investment, reproduction cost, or original cost. Depending on which method is used, the rate base includes cash, working capital, materials and supplies, and deductions for accumulated provisions for depreciation, contributions in aid of construction, customer advances for construction, accumulated deferred income taxes, and accumulated deferred investment tax credits.

Residential Sector: The residential sector includes private household establishments that consume energy primarily for space heating, water heating, air conditioning, lighting, refrigeration, cooking, and clothes drying. The classification of an individual consumer's account, where the use is both residential and commercial, is based on principal use. Apartment houses are included.

Retail: Sales covering electrical energy supplied for residential, commercial, and industrial end-use purposes. Other small classes, such as agriculture and street lighting, also are included in this category.

Rural Electrification Administration (REA): A lending agency of the U.S. Department of Agriculture, the REA makes self-liquidation loans to qualified borrowers to finance electric and telephone service to rural areas. The REA also finances the construction and operation of generating plants, electric transmission and distribution lines, or systems for the furnishing of initial and continued adequate electric services to persons in rural areas not receiving central station service.

Sales: The amount of kilowatthours sold in a given period of time; usually grouped by classes of service, such as residential, commercial, industrial, and other. Other sales include public street and highway lighting,

other sales to public authorities, sales to railroads and railways, and interdepartmental sales.

Schedule: A statement of the pricing format of electricity and the terms and conditions governing its applications.

Seasonal Rates: Different seasons of the year are structured into an electric rate schedule whereby an electric utility provides service to consumers at different rates. The electric rate schedule usually takes into account demand based on weather and other factors.

Special Contract Rate Schedule: An electric rate schedule for an electric service agreement between a utility and another party in addition to, or independent of, any standard rate schedule.

Special Purpose Rate Schedule: An electric rate schedule limited in its application to some particular purpose

or process within one, or more than one, type of industry or business.

Tariff: A published volume of rate schedules and general terms and conditions under which a product or service will be supplied.

Time-of-Day Rate: The rate charged by an electric utility for service to various classes of customers. The rate reflects the different costs of providing the service at different times of the day.

Watt: The electrical unit of power. The rate of energy transfer equivalent to 1 ampere flowing under a pressure of 1 volt at unity power factor.

Watthour (Wh): An electrical energy unit of measure equal to 1 watt of power supplied to, or taken from, an electric circuit steadily for 1 hour.

THE ONLY TOOL YOU NEED TO ANSWER THE CENSUS.

A simple pencil, a little time. That's all it takes to fill out your census form. So when it arrives,

just reach for your pencil, mark your answers, and send it back to us. We'll do the rest.

ANSWER THE CENSUS APRIL 1, 1990

It counts for more than you think!

Electric Sales and Revenue

1989

January 1991

ENERGY INFORMATION ADMINISTRATION
Office of Coal, Nuclear, Electric and Alternate Fuels
U.S. Department of Energy
Washington, DC 20585

Preface

The *Electric Sales and Revenue* is prepared by the Electric Power Division, Office of Coal, Nuclear, Electric and Alternate Fuels; Energy Information Administration (EIA); U.S. Department of Energy. This publication provides information about sales of electricity, its associated revenue, and the average revenue per kilowatthour sold to residential, commercial, industrial, and other consumers throughout the United States. Previous issues of this publication presented data on typical electric bills at specified consumption levels as well as sales, revenue, and average revenue. Data on typical electric bills have been omitted from this publication because of the discontinuation of the Form EIA-213, "Typical Net Monthly Bills," and the data on sales of electricity, its associated revenue, and the average revenue per kilowatthour sold to ultimate consumers have been expanded to include individual electric utility statistics by class of service and sector.

The sales, revenue, and average revenue per kilowatthour provided in the *Electric Sales and Revenue* are based on annual data reported by electric utilities for the calendar year ending December 31, 1989. The electric revenue reported by each electric utility includes the revenue billed for the amount of kilowatthours sold, revenue from State and local taxes, energy or demand charges, consumer service charges, environmental surcharges, franchise fees, fuel adjustments, and other miscellaneous charges. Average revenue per kilowatthour is defined as the cost per unit of electricity sold and is calculated by dividing retail sales into the associated electric revenue. The sales of electricity, associated revenue, and average revenue per kilowatthour provided in this report are presented at the national, Census division, State, and electric utility levels.

Target Audience

In the private sector, users of the *Electric Sales and Revenue* include researchers, analysts, and ultimately the policy- and decision-making members of electric utility companies. Other users include financial and investment institutions, economic development organizations, special interest groups, lobbyists, electric power associations, and the news media.

In the public sector, the users include analysts, researchers, statisticians, and other professionals engaged in regulatory, policy, and program areas for Federal,

State, and local governments. The Congress and other legislative bodies will also be interested in general trends related to electricity at State and national levels. Data in this report can be used in analytic studies to evaluate new legislation and regulatory alternatives, and to forecast future demand for electric power. Public service commissions and other special government groups share an interest in State-level statistics. These groups can compare the statistics for their States with those of other jurisdictions.

Coverage of Sources

Data published in the *Electric Sales and Revenue* are compiled from the Form EIA-861, "Annual Electric Utility Report." A brief description of the form follows. The form is described in more detail in Appendix B, "Technical Notes." Copies of the form and its instructions may be obtained from the National Energy Information Center (NEIC). The address is listed in the section "Contacts."

The Form EIA-861 is a census of electric utilities in the United States, its territories, and Puerto Rico. The form is used to collect information on the production and sale of electricity from approximately 3,250 electric utilities (Figure 1). This publication presents data on the number of consumers, sales, and revenue reported on the Form EIA-861. Data on the number of consumers are presented in Tables 5, 8, 14 through 17, and in Figures 2 through 4. Data on the sales of electricity to ultimate consumers are presented in Tables 1, 3, 4, 6, 9, 14 through 17, and A1. Additional sales data are presented in Figures 5, 7, 9 and 11. Data on the revenue from sales of electricity to ultimate consumers are presented in Tables 1, 3, 4, 7, 10, and 14 through 17. Revenue data are also presented in Figures 6, 7, 10 and 11. Average revenue per kilowatthour presented in this publication are calculated by dividing sales into revenue. Data on the average revenue per kilowatthour is presented in Tables 2, 11 through 13, and 14 through 17. These data are also presented in Figures 8 and 12 through 16. Since electric rates vary based on energy usage, average revenue per kilowatthour are affected by changes in the volume of sales.

Data on sales, revenue, and average revenue per kilowatthour presented in this publication differ somewhat from estimated data collected on the Form EIA-826, "Monthly Electric Sales and Revenue Report

with State Distributions,” published in the *Electric Power Monthly* and in the *Electric Power Annual* for 1987 and prior years. Both forms use sectoral classifications based on similar classification of consumers by electric utilities. At the national level, the figures reported on the Forms EIA-861 and EIA-826 correspond fairly closely; however, some large differences have

been observed at the State level. (For a more detailed discussion, see Appendix B.)

Data for the four power authorities of American Samoa, Guam, Puerto Rico, and the Virgin Islands are included only in Tables 14 through 17, and not in the national, Census division, and State level statistics.

Profile

This chapter contains two sections. The "Background" section provides a discussion on 1) sales of electricity, its associated revenue, and the average revenue per kilowatthour sold to ultimate consumers; 2) the classes of electric utility ownership; and 3) the classes of service or sectors. The "Year at a Glance" section provides a summary of pertinent statistics during the year related to sales of electricity, associated revenue, and average revenue per kilowatthour.

Background

Sales, Revenue, and Average Revenue per Kilowatthour.

Electric power is an integral part of our way of life. It is indispensable to the factory, the commercial establishment, the home, and even most recreational facilities. The unavailability of electric power causes inconvenience to customers as well as the economic loss of industrial production. Electric companies are responsible for ensuring an adequate and reliable source of electricity to all consumers in their service territories at a reasonable cost.

The service territory of an electric utility is geographically distinct and is usually composed of many different combinations of consumers. Electric utilities classify their consumers by different factors, such as demand, rate schedule, Standard Industrial Classification (SIC) code, distribution voltage, accounting methods, end-use applications, and other social and economic characteristics. Electric utilities use consumer classifications for planning (load growth, peak demands) and for determining their sales and revenue requirements (cost of service), from which they derive their rates.

Average revenue per kilowatthour is defined as the cost per unit of electricity sold and is calculated by dividing retail electric revenue by the corresponding sales of electricity. The average revenue per kilowatthour is calculated for all consumers and for each sector (residential, commercial, industrial, and other sales). The average revenue per kilowatthour represents an average of all consumption levels and rates. The electric revenue used to derive the average revenue per kilowatthour is the gross revenue reported by the electric utility. Electric revenue includes State and local taxes, energy or demand charges, consumer service charges, environmental surcharges, franchise fees, fuel adjustments, and other miscellaneous charges. State and local taxes are collected by the electric utility

as part of their billing process but are expensed out and passed along to the appropriate taxing authority.

Average revenue per kilowatthour is affected by changes in the rate schedules used by the electric utilities and by changes in the volume of electricity sales. Because fixed charges remain constant regardless of the volume of sales, average revenue per kilowatthour will decrease as the volume of sales increases. A change in average revenue per kilowatthour may occur when the volume of electricity sales changes (because of an increase/decrease in the use of electricity by the individual consumer or an increase/decrease in the number of ultimate consumers) across all sectors or within a specific sector. Generally, the rate schedules used by electric utilities are designed such that revenue decreases as the volume of sales increases, lowering the average revenue. The net effect of these trends on the average revenue per kilowatthour presented in this publication has not been determined.

The previous issues of this publication presented data on typical electric bills at specified consumption levels and rates. Data on typical electric bills has been omitted from this publication because of the discontinuation of the Form EIA-213, "Typical Net Monthly Bills." The typical electric bills were based on the specific rate (January 1 of the reporting year) applicable to the largest number of consumers within the service area of the utility at specified levels of demand and consumption. Average revenue per kilowatthour is in part impacted by class of utility ownership and by class of service (sector). Consequently, data in this publication are presented by class of ownership and sector.

Classes of Ownership. The electric power industry in the United States is a combination of over 3,200 investor-owned (privately owned), publicly owned, Federal, and cooperative electric utilities. Historically, investor-owned electric utilities have been most successful in serving large, consolidated markets where economies-of-scale afforded the lowest prices. However, publicly owned, Federal, and cooperative electric utilities all have a role in producing, transmitting, and distributing electricity (Figures 1 through 4).

Like all private businesses, the fundamental objective of an investor-owned utility is to produce a return for its investors. The investor-owned electric utility either distributes its profits to stockholders as dividends or reinvests these profits. It is granted a service monopoly

in certain geographic areas and is obliged to serve all consumers. As franchised monopolies, these utilities are regulated and required to charge reasonable prices, to charge comparable prices to similar classifications of consumers, and to give consumers access to services under similar conditions. Most investor-owned electric utilities are operating companies that provide basic services for the generation, transmission, and distribution of electricity. The majority of investor-owned utilities perform all three functions. There are approximately 260 investor-owned electric utilities operating all States except Nebraska. The electric utilities in Nebraska consist primarily of municipal systems and public power districts. Hawaii is the only State in which all electricity generation is supplied by investor-owned electric utilities. Investor-owned electric utilities currently account for more than 75 percent of all electric utility generating capability, generation, sales, and revenue in the United States.

Publicly owned electric utilities are nonprofit local government agencies established to serve their communities and nearby consumers at cost, returning excess funds to the consumer in the form of community contributions, more economic and efficient facilities, and lower rates. Publicly owned electric utilities (which number approximately 2,000) include municipalities, public power districts, State authorities, irrigation districts, and other State organizations. Most municipal utilities simply distribute power, although some larger ones produce and transmit electricity as well. They obtain their financing from municipal treasuries and from revenue bonds secured by proceeds from the sale of electricity. Public power districts and projects are concentrated in Nebraska (which has no investor-owned electric utilities), Washington, Oregon, Arizona, and California. Voters in a public utility district (PUD) elect commissioners or directors to govern the district independent of any municipal government. State authorities, like the Power Authority of the State of New York or the South Carolina Public Service Authority, are agencies of their respective State government. Irrigation districts may have still other forms of organization. In the Salt River Project, votes for the board of directors are apportioned according to the size of landholdings.

Cooperative electric utilities are owned by their members and are established to provide electricity to those members. These electric utilities operate in rural areas with a lower concentration of consumers because these areas were historically viewed as uneconomical operations for investor-owned electric utilities. They are incorporated under State law and are usually directed by an elected board of directors, which in turn selects a manager. The Rural Electrification Administration, the National Rural Utilities Cooperative Finance Corporation, the Federal Financing Bank, and the Bank for Cooperatives are the most important sources of

debt financing for electric cooperatives. There are approximately 960 electric cooperatives currently doing business in 47 States. Cooperative electric utilities do not operate in Connecticut, Hawaii, and Rhode Island, or in the District of Columbia.

There are 10 Federal electric utilities in the United States. They are the Department of Defense-U.S. Army Corps of Engineers; the Department of Energy-Alaska, Bonneville, Southeastern, Southwestern, and Western Area Power Administrations; the Department of Interior-U.S. Bureau of Indian Affairs and Bureau of Reclamation; the Department of State-International Water and Boundary Commission; and, the Tennessee Valley Authority. The Federal electric utilities are primarily generators and wholesalers of electricity rather than distributors to ultimate consumers. Federal electric utilities operate more than 150 power plants and produce approximately 8 percent of the electricity generated in the United States. Most of the power plants are Federal hydroelectric projects initially designed for flood control and irrigation purposes. Federal power is not sold for profit, but to recover the cost of operations. Most Federal generation is sold for resale to municipals, cooperative electric utilities, and other nonprofit preference customers, as required by law. There are three major Federal producers of electricity: the Tennessee Valley Authority (TVA), the largest Federal producer, the U.S. Army Corps of Engineers (USCE), and the U.S. Bureau of Reclamation (USBR). The TVA markets its own power while the generation by the USCE, except for the North Central Division (St. Mary's Falls at Sault St. Marie, Michigan), and the USBR is marketed by four of the Federal power marketing administrations (PMA), Bonneville, Southeastern, Southwestern, and Western Area. The four PMA's also purchase energy for resale from other electric utilities in the United States and Canada. Alaska, the fifth PMA, operates its own power plants and distributes power to ultimate consumers. The majority of electricity generated by Federal electric utilities is sold for resale, not to ultimate consumers.

Classes of Service (Sectors). In general, consumers are divided into classes or sectors based on the type of service they receive. The sectorial categorization of ultimate consumers is determined by the electric utility based on its service territory, size, location, ownership, and regulatory structure. The generic sectors (*residential, commercial, and industrial*) reflect the type of service consumers receive.

The residential sector includes electricity supplied to private household establishments and apartment buildings where energy is consumed primarily for space heating, water heating, air conditioning, lighting, refrigeration, cooking, and clothes drying. Electricity supplied for irrigation is sometimes included in this sector.

The commercial sector includes electricity supplied to nonmanufacturing business establishments, including hotels, motels, restaurants, wholesale businesses, and retail stores; and health, social, and educational institutions. An electric utility may classify commercial consumers as those consumers whose demand or usage exceeds some specified limit. The limit may be set by the electric utility based on its rate schedule.

The industrial sector includes electricity supplied to manufacturing, construction, mining, agriculture, fishing, and forestry establishments -- Standard Industrial Classification (SIC) codes 1-39. An electric utility may classify industrial consumers using these SIC codes, or it may classify industrial consumers based on demand or usage exceeding some specified limit. As in the commercial sector, the limit may be set by the electric utility based on its rate schedule.

Sales to other consumers include public street and highway lighting, railroads and railways, municipalities, divisions or agencies of State and Federal Governments under special contracts or agreements, and other utility departments, as defined by the pertinent regulatory agency and/or electric utility. Sales to these consumers, as well as the residential, commercial, and industrial consumers may be classified differently by each electric utility because of different rates, demand levels, and the economic activities of the consumers.

The Year at a Glance

In 1989, total sales of electricity to ultimate consumers were 2,647 billion kilowatthours and total revenue was \$171 billion (Table 1, Figures 5 and 6). Sales to the residential sector in 1989 were 906 billion kilowatthours and revenue was \$69 billion. The commercial and industrial sectors had sales of 726 and 926 billion kilowatthours, and revenue of \$52 and \$44 billion, respectively. The weighted average revenue per kilowatthour of electricity sold to ultimate consumers in the United States in 1989 was 6.5 cents (Table 2, Figures 8 and 12). The average revenue per kilowatthour for the residential sector was 7.6 cents in 1989. The average revenue per kilowatthour for the commercial and industrial sectors for 1989 were 7.2 and 4.7 cents, respectively.

Average Revenue by Sector and Type. Since, Federal electric utilities have access to relatively low-cost financing and mostly utilize less expensive hydroelectric facilities, they have the lowest average revenue per kilowatthour of all the ownership classes and sectors.

The average revenue per kilowatthour of publicly owned electric utilities in the residential sector, at 6.3 cents, was 15 percent below that for cooperative electric utilities (7.4 cents); and 21 percent below that of investor-owned electric utilities (8.0 cents), (Table 2, Figures 8 and 12). The average revenue per kilowatthour of publicly owned electric utilities in the commercial sector, at 6.4 cents, was 11 percent below that for cooperative electric utilities (7.2 cents); and 12 percent below that for investor-owned electric utilities (7.3 cents). For the industrial sector, publicly owned and investor-owned electric utilities both had average revenue per kilowatthour of 4.7 cents, 6 percent below that for cooperative electric utilities.

Sales by Sector. Sales of electricity rose by less than 3 percent in 1989, compared with an increase of 5 percent in 1988. A record for total sales of electricity was set in 1989 at 2,647 billion kilowatthours; while actual sales in all the major electricity-consuming end-use sectors grew less in 1989 than in 1988 (Table 3, Figures 5 and 7). Sales of electricity to the residential sector increased by 1 percent or 13 billion kilowatthours in 1989. The total output of industrial goods increased by 3 percent in 1989,¹ compared with 1988, which lead to a 3-percent or 29 billion kilowatthour increase in industrial sales of electricity. Sales of electricity to the commercial sector increased by 4 percent or 27 billion kilowatthours.

Revenue by Sector. The total revenue from sales of electricity was 4 percent more than in 1988 (Table 3, Figures 6 and 7). Revenue increased by 4 percent for the residential sector and by 6 percent for the commercial sector in 1989. Revenue for the industrial sector increased by 4 percent in 1989.

Sales by Type of Ownership. Among the ownership classes, investor-owned electric utilities accounted for 77 percent (2,032 billion kilowatthours) of total U.S. sales of electricity in 1989 (Table 4, Figures 9 and 11). Publicly owned electric utilities accounted for 14 percent, or 372 billion kilowatthours; electric cooperative utilities accounted for 7 percent, or 190 billion kilowatthours; and, Federal electric utilities accounted for 2 percent, or 53 billion kilowatthours, of total U.S. sales in 1989. Investor-owned electric utilities reported a 3-percent increase in sales of electricity to ultimate consumers, while publicly owned electric utilities only reported a 2-percent increase in sales of electricity. Sales of electricity for cooperative electric utilities increased by 4 percent. Federal electric utilities reported a 3-percent increase in sales of electricity to ultimate consumers in 1989.

¹U.S. Department of Commerce, Bureau of Economic Analysis, *Survey of Current Business*, March 1990, Vol. 70, No. 3, p. S1.

Revenue by Type of Ownership. All ownership classes reported 4 percent increases in 1989 in their revenue from sales of electricity to ultimate consumers except Federal electric utilities, which reported a 2-percent decrease in 1989 (Table 4, Figures 10 and 11).

Average Revenue by Type of Ownership. In 1989, Federal electric utilities continued to have the lowest average revenue per kilowatthour at 3.6 cents, a 5-percent decrease from 1988 (Table 11, Figure 12). Federal electric utilities generally have lower average revenue per kilowatthour because they are exempt from income tax, have access to lower interest loans, and use less expensive hydroelectric power. In addition, many Federal hydroelectric projects are multi-purpose projects and only a portion of the costs are allocated to electricity. Federal electric utilities set rates to recover only the cost of service and generally have no distinction between rates for wholesale and retail consumers. Average revenue per kilowatthour for publicly owned

electric utilities was also lower than that of investor-owned electric utilities and cooperative electric utilities. Publicly owned electric utilities have access to low-cost capital and are not allowed to charge a return for profit. Publicly owned electric utilities had an average revenue per kilowatthour of 5.8 cents in 1989, a 2-percent increase from 1988.

Investor-owned electric utilities had an average revenue per kilowatthour of 6.6 cents in 1989, a 2-percent increase from 1988 (Table 11, Figure 12). Although cooperative electric utilities have access to low-cost loans through the Rural Electrification Administration, they had the highest average revenue per kilowatthour at 6.9 cents in 1989, a 1-percent increase from 1988. The higher average revenue per kilowatthour by this ownership group is at least partly attributable to the high cost of operating in remote rural areas having a low concentration of consumers.

Table 1. Sales to Ultimate Consumers and Associated Revenue by Sector, 1989

Item	Residential	Commercial	Industrial	Other ¹	Total
Sales (million kilowatthours) ..	905,525	725,861	925,659	89,765	2,646,809
Revenue (thousand dollars) ...	69,240,395	52,227,813	43,718,893	5,609,495	170,796,596

¹ Includes public street and highway lighting, other sales to public authorities, sales to railroads and railways, and interdepartmental sales.

Sales and Revenue

This chapter provides a discussion on revenue requirements, the allocation of revenue across sectors, and rate schedules. Also provided are summary statistics on the sale of electricity to ultimate consumers and the associated revenue. This information is provided at the national, Census division, and State levels.

Cost of Electricity

The process of determining the cost of electricity generally follows three stages: 1) revenue requirements are determined 2) the revenue is allocated to different classes of service (sectors) and 3) rate schedules for each sector are established.

Revenue Requirements. Revenue requirements are set to reimburse the electric utility for providing electric service. The revenue requirements reflect the anticipated cost of providing services for some period of time in the future, usually a year. Revenue requirements include investment depreciation, expenses for the production, transmission, and distribution systems, as well as sales costs, consumer costs, Federal and other taxes, and administration and general expenses. The revenue requirements also include an allowance for the profit of the electric utility, if applicable.

Allocation of Revenue. The cost of service to particular sectors and the mix of consumers served in the sectors provide guidelines for determining how much of the revenue must be collected from each sector. For example, the cost of service to the residential sector is usually higher than the cost to the commercial or industrial sectors because of the large number of consumers served, amount of distribution lines needed to provide the service, and the low consumption levels. The economic activity or type of business of the ultimate consumer is not necessarily the means by which electric utilities classify their consumers to determine revenue requirements and set rates. Electric utilities, in many instances, determine their revenue requirements and set their rates based on the level of demand and/or consumption of electricity.

The residential sector represents 88 percent of the total number of consumers, while accounting for only 34 percent of the total sales of electricity. The industrial sector, which has more than an equal share of sales, 35

percent, accounts for less than 1 percent of the total number of consumers. The commercial sector, which represents 11 percent of the total number of consumers, accounts for 27 percent of total sales. The remaining share of sales is accounted for by the other sector, which includes public street and highway lighting, railroads and railways, municipalities, divisions or agencies of State and Federal Governments under special contracts or agreements, and other utility departments, as defined by the pertinent regulatory agency and/or electric utility. Investor-owned electric utilities serve approximately three-fourths of the total number of ultimate consumers. Publicly owned electric utilities and electric cooperatives serve nearly all the remaining ultimate consumers as federally owned electric utilities have very few retail sales and sell almost exclusively to other electric utilities.

Rate Schedules. In general, the rate schedules for most electric utilities are designed to allow for operation, generation, maintenance, rental fees for equipment, and demand and service charges. Operation, generation, maintenance, and rental fees for equipment are usually fixed charges that are assessed monthly or annually. Demand charges are also fixed, but they vary with respect to volume of sales. A more detailed discussion of these charges is contained in Chapter 3, "Average Revenue."

The rate schedules developed to generate revenue for electric utilities are unique to each utility. The rates reflect any number of considerations that are important to the economic welfare of the electric utility and may reflect other interests as well, such as residential rates that provide economic service to low-income families. Generally, commercial or industrial billings are determined more by the level of demand/consumption of electricity than by the type of economic activity in which the consumer is engaged.

For instance, while commercial and industrial consumers are billed according to a particular rate schedule that frequently reflects the type of business indicated by that schedule, there are exceptions. A light manufacturing establishment with a manufacturing process that consumes little energy could be billed at a commercial rate because its consumption is not high enough to fall into the industrial schedule. Conversely, a very large commercial building might have sufficiently large consumption to be billed at the industrial rate.

Sectorial classification of consumers may change over the course of a year as consumption varies. As a result, the rate schedule that would be applicable may vary. For example, a very large commercial building may have a high level of consumption during the summer because of air conditioning equipment and thus would be billed at industrial rates. However, in the winter, if the building is heated by gas, consumption of electricity may decline and commercial rates may be applied for billing purposes rather than industrial rates.

The authority for the approval of these rates is based on the class of utility ownership. For example, investor-owned electric utilities are regulated by State public service commissions and the Federal Energy Regulatory Commission. Publicly owned electric utilities, in

most States, are regulated by their consumer-owners through locally elected or appointed officials. A more detailed discussion on utility classes of ownership is contained in the "Introduction" section of the first chapter in this publication.

Data Sources. Tables 3 through 10 contain data on the retail sales of electricity, its associated revenue, and the average number of consumers at the national, Census and State levels by sector and class of utility ownership. Statistics contained in Tables 3 through 10 are based on data collected on the Form EIA-861, "Annual Electric Utility Report." Data for the four power authorities of American Samoa, Guam, Puerto Rico, and the Virgin Islands, are not included in the summary statistics.

Electricity provides energy to light homes and shopping centers, and to run factories.

Average Revenue per Kilowatthour

This chapter provides summary statistics on the average revenue per kilowatthour at the national, Census division, State, and electric utility levels.

Average Revenue per Kilowatthour at the National, Regional, and State Level

The average revenue per kilowatthour by sector and State is calculated by dividing total annual revenue by total annual retail sales for each sector and State. The resulting measurement is the cost per kilowatthour of electricity sold for providing service to a sector given the rate schedule of the electric utility for that particular sector. Many rate schedules have a minimum service charge and most have a declining rate per unit of consumption as consumption increases. Rate schedules for the commercial and industrial sectors almost always have a demand charge in addition to an energy charge. These factors lower the average revenue per kilowatthour as the average consumption increases.

The average revenue per kilowatthour for residential consumers is generally higher than for any other sector due in part to higher costs associated with serving many consumers who use relatively small amounts of electricity. These costs include direct-load costs (such as those for distribution lines, transformers, and meters) in addition to consumer or administrative costs. The industrial sector, which generally covers consumers

with the highest use of electricity, has the lowest rates due to the economies of serving a few consumers who use relatively large amounts of electricity. Average revenue per kilowatthour for the residential sector has increased slightly since 1985. The commercial and industrial average revenue per kilowatthour decreased from 1985 through 1988. Some State utility commissions, during this period, approved lower rates in the commercial and industrial sector in order to better represent the cost of service. In some instances, these lower rates were approved in order to stimulate use of electricity in the commercial and industrial sectors. In 1989, the average revenue per kilowatthour for the commercial and industrial sectors increased and remained unchanged, respectively.

Federal electric utilities generally have the lowest average revenue per kilowatthour for the ownership classes because they have access to relatively low-cost financing and mostly utilize less expensive hydroelectric facilities. Because publicly owned electric utilities also have access to relatively low-cost financing and are nonprofit entities, they have lower average revenue per kilowatthour than investor-owned electric utilities. Although cooperative electric utilities have economic advantages similar to those of the publicly owned electric utilities, they generally serve sparsely populated areas. As a consequence, cooperative electric utilities generally have higher average revenue per kilowatthour than do investor-owned utilities.

Because of the type and availability of capacity and the cost of fuel, the average revenue per kilowatthour differs across U. S. Census divisions. The New England and Middle Atlantic Census Divisions tend to have an average revenue per kilowatthour that is higher than average because of their reliance on petroleum, whereas the East and West South Central Divisions rely on gas-fired generation and the East North Central and South Atlantic Divisions rely on coal-fired generation. Petroleum is generally a more expensive energy source than coal and natural gas. Because the Mountain Census Division relies on less expensive hydroelectric generation, the average revenue per kilowatthour in this region is usually below the national average for

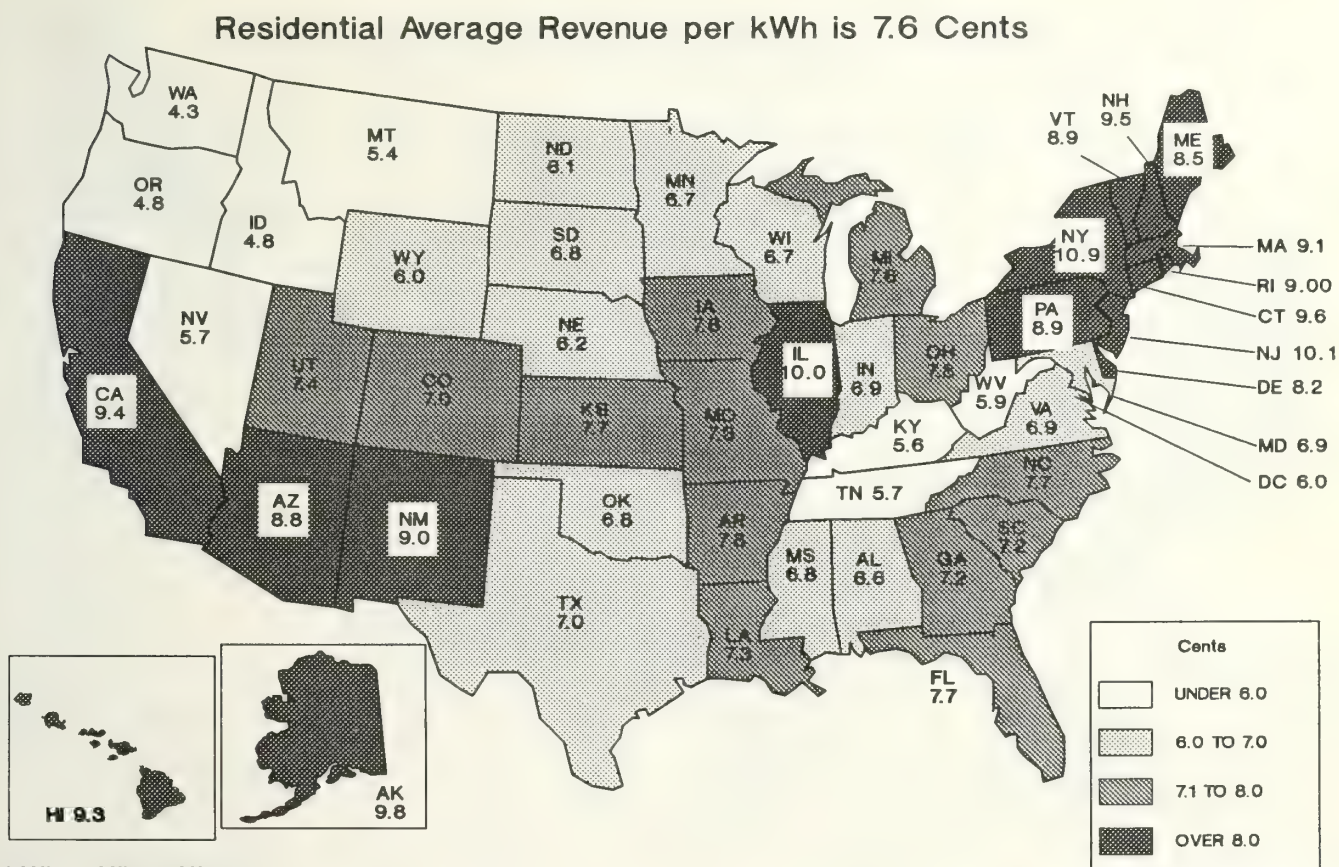

all classes of consumers. The Census divisions where Federal hydroelectric facilities provide significant amounts of electricity, such as the East South Central Division, also have lower than average revenue per kilowatthour.

Tables 11 through 13 contain summary statistics on the average revenue per kilowatthour of electricity sold at the national, Census division, and State level by sector and class of utility ownership. Data for the four power authorities of American Samoa, Guam, Puerto Rico, and the Virgin Islands are not included in the summary statistics.

Average Revenue per Kilowatthour at the Electric Utility Level

The average revenue per kilowatthour of electricity sold for each utility is calculated in this report by dividing the total annual revenue of the electric utility by its total annual sales of electricity across all sectors. Because the average revenue per kilowatthour varies between sectors, the difference in average revenue per kilowatthour between utilities may represent a difference in their proportion of sales in the different sectors. Accordingly, the average revenue for a given utility does not reflect the differences that may exist in its revenue structure across sectors. The average revenue per kilowatthour at the utility level is usually between 4 and 12 cents per kilowatthour but the average may be larger or smaller for a particular sector, ownership type, or State.

Cooperative electric utilities are owned by their members and are established to provide electricity to those members. These electric utilities operate in rural areas with a lower concentration of consumers because these areas were historically viewed as uneconomical operations for investor-owned electric utilities. Cooperative electric utilities generally have broader service areas with smaller consumer bases than other ownership types and, as a consequence, they tend to have higher average revenue per kilowatthour. Cooperative electric utilities that serve consumers in multiple States tend to have even broader service areas and higher average revenue per kilowatthour. Because of these characteristics, the average revenue per kilowatthour for the majority of cooperative electric utilities is not provided in Tables 14 through 17 as they reported either less than 100 thousand dollars of revenue or less than one million kilowatthours of sales.

For example, the Columbus Electric Cooperative, Incorporated in New Mexico serves consumers in New Mexico as well as in Arizona. The residential average revenue per kilowatthour in Table 14 is 12.5 cents for both States. The commercial average revenue per kilowatthour in Table 15 is 11.0 cents for New Mexico. The commercial average revenue per kilowatthour is not provided in for Arizona because the electric utility reported either less than 100 thousand dollars of revenue or one million kilowatthours of sales in this State.

Federal electric utilities generally have the lowest average revenue per kilowatthour for the ownership classes because they have access to relatively low-cost financing and primarily utilize less expensive hydro-electric facilities. The Department of Energy, Western Area Power Administration (WAPA) serves residential consumers in California and Colorado (Table 14) and commercial consumers in Montana (Table 15) but because WAPA reported either less than 100 thousand dollars of revenue or one million kilowatthours of

sales, the average revenue per kilowatthour is not provided in these tables.

The majority of electric utilities in Alaska have average revenue per kilowatthour exceeding the U.S. average. This occurs in part due to the lack of economies of scale in Alaska and because of the high costs associated with generation and distribution. The electric utilities that have higher costs charge higher rates for electricity that are designed to recover these costs from their consumers. In 1985, Alaskan electric utilities that used diesel fuel for most of their power generation in 1984, those that are not located in the Anchorage, Fairbanks, and Juneau areas, and those not previously given a power production subsidy in 1980 and 1981, were given a rate rebate or Power Cost Equalization (PCE) subsidy by the State of Alaska. The PCE program was initially designed to compensate consumers served by electric utilities located in rural areas where transmission access is limited and generating with expensive diesel gas turbines is the only practical means of providing electricity. The Alaska Energy Authority (AEA) administers the subsidy with funds from a State statute since Alaska has no State income tax. Electric utilities qualifying for the PCE program are required to notify consumers of the cost of electric service and the cost minus the State equalization. Consumers receiving the subsidy do not actually pay the high rates. The subsidy is allocated to electric utilities based on consumer sector and demand for electricity within each sector. In Tables 14 through 17, the PCE subsidy has not been subtracted from the total revenue of those electric utilities receiving compensation for high energy costs.

One example of the subsidy in Table 14 is the Alaska Village Electric Cooperative, Incorporated (AVEC) which has a residential average revenue per kilowatthour of 40.6 cents in 1989. The AVEC has an average subsidy of 25.9 cents² for all consumer classifications except industrial (large commercial) consumers over 1,500 kilowatthours. The adjusted residential average revenue per kilowatthour would be approximately 14.7 cents and that is the price the consumer pays.

Electric utilities operating on islands with high seasonal populations also tend to have much higher average revenue per kilowatthour because higher demand charges are needed to recover the fixed equipment and operating costs associated with generating electricity at infrequent times. These electric utilities are few and are primarily located on the East Coast and in the Great Lakes area. For example, the Fischer's Island Electric Corporation in New York serves residential and commercial consumers with average revenue per kilowatthour of 21.0 and 19.5 cents, respectively. These consumers pay a demand charge of approximately 10.2 cents per kilowatthour and an energy charge of

²Alaska Energy Authority, *Second Annual Statistical Report of the Power Cost Equalization Program*, (Anchorage, AK, March 1990), p. 17.

approximately 4.8 cents per kilowatthour. An additional surcharge for submarine cables is approximately 1.9 cents per kilowatthour for the first 0-12 kilowatthours, 15.2 cents for the next 300 kilowatthours, and 11.2 cents for usage over 300 kilowatthours.

Data on the number of consumers, revenue, sales, and average revenue per kilowatthour for individual electric utilities are contained in Tables 14 through 17. The average revenue per kilowatthour presented in Tables 14 through 17 are based on an average for each of the end-use sectors. When an electric utility serves ultimate consumers in more than one State, that utility is listed under each State it serves. The electric utilities in Table 14 through 17 that serve ultimate consumers in more than one State and their percent of sales in each State are provided in Appendix A. Tables 14 through 16 contain the respective consumers, sales, revenue, and average revenue per kilowatthour by each sector for all electric utilities. Table 17 contains the respective sales, revenue, and average revenue for the sum of all

sectors. This includes the residential, commercial, and industrial sectors, as well as public street and highway lighting, interdepartmental sales, sales to railroads and railways, and sales to other public authorities.

Electric revenue and sales data are reported by electric utilities in thousand dollars and thousand kilowatthours. Average revenue per kilowatthour for electric utilities with either less than 100 thousand dollars of revenue or less than one million kilowatthours of sales, are not provided because the significance of the data are not sufficient to make the ratio meaningful. See Appendix B for further information.

Data Sources. Statistics contained in Tables 11 through 17 are based on data collected on the Form EIA-861, "Annual Electric Utility Report." Data for the four power authorities of American Samoa, Guam, Puerto Rico, and the Virgin Islands are included only in Tables 14 through 17, and not in the summary statistics.

Around-the-clock operation is required in order that electric utilities may satisfy the needs of consumers of electricity.

Table 14. Number of Ultimate Consumers, Revenue, Sales, and Average Revenue per Kilowatthour for the Residential Sector, 1989

State Electric Utility	Class of Ownership	Number ¹ of Consumers	Revenue (thousand dollars)	Sales (thousand kilowatthours)	Average Revenue per kilowatthour ² (cents)

¹ The number of ultimate consumers is an average of the number of consumers at the close of each month.

² The average revenue per kilowatthour of electricity sold is calculated by dividing revenue by sales.

³ Most electric utilities in the State of Alaska that have average revenue per kilowatthour exceeding the U.S. average compensate their rural consumers through the State of Alaska, Power Cost Equalization (PCE) program. The PCE program was designed to offset the high generation and distribution costs that must otherwise be passed on to consumers in the form of high rates for electricity.

⁴ Electric revenue and sales data are reported by electric utilities in thousand dollars and thousand kilowatthours. Average revenue per kilowatthour for electric utilities with either less than 100 thousand dollars of revenue or less than 1 million kilowatthours of sales, are not provided because the significance of the data are not sufficient to make the ratio meaningful.

Note: Electric utilities serving consumers in more than one State are listed under each State served.

Source: Energy Information Administration, Form EIA-861, "Annual Electric Utility Report."

¹ The number of ultimate consumers is an average of the number of consumers at the close of each month.

² The average revenue per kilowatthour of electricity sold is calculated by dividing revenue by sales.

³ Most electric utilities in the State of Alaska that have average revenue per kilowatthour exceeding the U.S. average compensate their rural consumers through the State of Alaska, Power Cost Equalization (PCE) program. The PCE program was designed to offset the high generation and distribution costs that must otherwise be passed on to consumers in the form of high rates for electricity.

⁴ Electric revenue and sales data are reported by electric utilities in thousand dollars and thousand kilowatthours. Average revenue per kilowatthour for electric utilities with either less than 100 thousand dollars of revenue or less than 1 million kilowatthours of sales, are not provided because the significance of the data are not sufficient to make the ratio meaningful.

Note: Electric utilities serving consumers in more than one State are listed under each State served.

Source: Energy Information Administration, Form EIA-861, "Annual Electric Utility Report."

¹ The number of ultimate consumers is an average of the number of consumers at the close of each month.

² The average revenue per kilowatthour of electricity sold is calculated by dividing revenue by sales.

³ Most electric utilities in the State of Alaska that have average revenue per kilowatthour exceeding the U.S. average compensate their rural consumers through the State of Alaska, Power Cost Equalization (PCE) program. The PCE program was designed to offset the high generation and distribution costs that must otherwise be passed on to consumers in the form of high rates for electricity.

⁴ Electric revenue and sales data are reported by electric utilities in thousand dollars and thousand kilowatthours. Average revenue per kilowatthour for electric utilities with either less than 100 thousand dollars of revenue or less than 1 million kilowatthours of sales, are not provided because the significance of the data are not sufficient to make the ratio meaningful.

Note: Electric utilities serving consumers in more than one State are listed under each State served.

Source: Energy Information Administration, Form EIA-861, "Annual Electric Utility Report."

¹ The number of ultimate consumers is the sum across all sectors of the average number of consumers at the close of each month.

² The average revenue per kilowatthour of electricity sold is calculated by dividing revenue by sales.

³ Most electric utilities in the State of Alaska that have average revenue per kilowatthour exceeding the U.S. average compensate their rural consumers through the State of Alaska, Power Cost Equalization (PCE) program. The PCE program was designed to offset the high generation and distribution costs that must otherwise be passed on to consumers in the form of high rates for electricity.

⁴ Electric revenue and sales data are reported by electric utilities in thousand dollars and thousand kilowatthours. Average revenue per kilowatthour for electric utilities with either less than 100 thousand dollars of revenue or less than 1 million kilowatthours of sales, are not provided because the significance of the data are not sufficient to make the ratio meaningful.

Note: Electric utilities serving consumers in more than one State are listed under each State served.

Electric Utilities Serving Ultimate Consumers in More Than One State

This appendix contains information from the Form EIA-861, "Annual Electric Utility Report," regarding electric utilities that serve ultimate consumers in more than one State (Table A1). Additionally, the percent of sales of electricity in each State served is included in Table A1. The information can be used as a reference to Tables 14 through 17. For example, information contained in Table A1 indicates that the Appalachian Power Company serves consumers in the States of Virginia and West Virginia. Tables 14 through 17 contain

the respective sales, revenue, and average revenue by each sector and for all sectors for this electric utility in both States. The majority of utilities that serve ultimate consumers in more than one State are the investor-owned electric utilities. These electric utilities generally have large franchise service areas and historically have served in more than one State. Publicly owned electric utilities usually are chartered by municipal or State governments and usually only serve within the cities or counties where they are located.

Appendix B

Technical Notes

Technical Notes

Sources of Data

The *Electric Sales and Revenue (ESR)* is prepared by the Electric Power Division, Office of Coal, Nuclear, Electric and Alternate Fuels (CNEAF), Energy Information Administration (EIA), U.S. Department of Energy. Data published in the *ESR* are compiled from the EIA statistical Form EIA-861, "Annual Electric Utility Report." A brief summary of the form is presented below.

Form EIA-861

The Form EIA-861 is a mandatory census of electric utilities in the United States. The survey is used to collect information on power production and sales data from approximately 3,250 electric utilities. The data collected are used to maintain and update the electric utility frame data base of the EIA. This data base supports queries from the Executive Branch, Congress, other public agencies, and the general public. Summary data from the Form EIA-861 are also contained in the *Electric Power Monthly*, the *Electric Power Annual*, the *Financial Statistics of Selected Investor-owned Electric Utilities*, the *Financial Statistics of Selected Publicly Owned Electric Utilities*, and the *Annual Outlook for U.S. Electric Power*. These reports present aggregate totals for electric utilities at the national, regional, and State level by consumer classes. Data for the four power authorities of the Virgin Islands, American Samoa, Guam, and Puerto Rico are included only in the detailed tables, and not in the summary statistics.

Instrument and Design History. The Form EIA-861 was implemented in January 1985 to collect data as of year-end 1984. The Federal Energy Administration Act of 1974 (Public Law 93-275) defines the legislative authority to collect these data.

Data Processing. The Form EIA-861 is mailed to the respondents in January to collect data as of the end of the preceding calendar year. The completed forms are to be returned to the EIA by April 1. These data are manually edited before being entered into the interactive on-line system. Internal edit checks are performed to verify that current data total across and between schedules, and are comparable to data reported the

previous year. Edit checks are also performed to compare data reported on the Form EIA-861 with similar data reported on the Forms EIA-826, EIA-412, and Federal Energy Regulatory Commission Form 1. Respondents are telephoned to obtain clarification of reported data or to obtain missing data.

Form EIA-861 figures shown in this publication differ somewhat from the sum of the monthly Form EIA-826 figures for sales published in the *Electric Power Monthly* and in the *Electric Power Annual* for 1987 and prior years. Both forms use sectoral classifications (residential, commercial, and industrial) based on the usual classification of consumers by the utilities. The sectoral classification scheme for electricity sales can vary from utility to utility, as influenced by the local public utility commission. At the national level, the Form EIA-861 and Form EIA-826 figures corresponded closely (within 3 percent) for all end-use sectors. Some larger differences were observed at the State level particularly for Tennessee due to a misclassification of commercial and industrial data in the Form EIA-826 survey.

Differences between the Form EIA-861 and Form EIA-826 figures can result from the Form EIA-826 sampling procedure and/or from nonsampling error in either data collection. One source of nonsampling error in the Form EIA-826 stems from the practice of filing estimates for monthly sales and revenue when the actual figures are not yet available. Although respondents are instructed to file revisions, revisions are not always filed. The respondents are instructed to review their Form EIA-826 figures at the end of the reporting year to ensure consistency with Form EIA-861 figures. Survey analysts at the EIA compare these data series and attempt to resolve any differences. Nevertheless, some reporting differences remain.

Electric revenue and sales data are rounded and reported by electric utilities in thousand dollars and thousand kilowatthours. For this publication the average revenue per unit cost of electricity sold is calculated by dividing total electric revenue by the total sales of electricity. For Tables 14 through 17 the average revenue per kilowatthour for electric utilities with either less than 100 thousand dollars of revenue or less than one million kilowatthours of sales, are not provided because the significance of the data are not sufficient

to make the ratio meaningful. The average revenue per kilowatthour for these electric utilities could change by more than one-half cent.

Quality of Data

The CNEAF office is responsible for routine data improvement and quality assurance activities. All operations in this office are done in accordance with formal standards established by the EIA. These standards are the measuring rod necessary for quality statistics. Data improvement efforts include verification of data-keyed input by automatic computerized methods, editing by subject matter specialists, and followup on nonrespondents. The CNEAF office supports the quality assurance efforts of the data collectors by providing advisory reviews of the structure of information requirements and of proposed designs for new and revised data collection forms and systems. Once implemented, the actual performance of working data collection systems is also validated. Computerized respondent data files are checked to identify those who fail to respond to the survey. By law, nonrespondents may be fined or otherwise penalized for not filing a mandatory EIA data form. Before invoking the law, the EIA tries to obtain the required information by encouraging cooperation of nonrespondents.

Completed forms received by the CNEAF office are sorted, screened for completeness of reported information, and keyed onto computer tapes for storage and transfer to random access data bases for computer processing. The information coded on the computer tapes is manually spot-checked against the forms to certify accuracy of the tapes. To ensure the quality standards established by the EIA, formulas that use the past history of data values in the data base have been designed and implemented to automatically check data input for errors. Data values that fall outside the ranges prescribed in the formulas are verified by telephoning respondents to resolve any discrepancies.

Data Editing System

Data from the Form EIA-861 are edited on an annual basis using automated systems. The edits include both deterministic checks, in which records are checked for

the presence of required fields and their validity, and statistical checks, in which estimation techniques are used to validate data according to their behavior in the past and in comparison to other current fields.

Confidentiality of the Data

The data collected on the forms used for input to this report are not confidential.

Formulas

Average Revenue per Kilowatthour. The average revenue per unit cost of electricity sold is calculated by dividing total annual revenue by total annual sales of electricity.

Rounding Rules for Data

Given a number with r digits to the left of the decimal and $d+t$ digits in the fraction part, with d being the place to which the number is to be rounded and t being the remaining digits that will be truncated, this number is rounded to $r+d$ digits by adding 5 to the $(r+d+1)$ th digit when the number is positive or by subtracting 5 when the number is negative. The t digits are then truncated at the $(r+d+1)$ th digit. The symbol for a rounded number truncated to zero is (*).

Data Correction Procedure

The CNEAF office has adopted the following policy with respect to the revision and correction of data published in energy data reports and made available in a machine format:

- Publication of these data results in their finalization at which point the data base is closed.
- Revisions or corrections are made only in the event a substantial (greater than 1 percent) reporting change is received or a substantial (greater than 1 percent) error is discovered.
- No revisions will be made without the approval of the Director, Electric Power Division.

Table B1. Unit-of-Measure Equivalents for Electricity

Unit	Equivalent		
Kilowatt (kW)	1,000	(One Thousand)	Watts
Megawatt (MW)	1,000,000	(One Million)	Watts
Gigawatt (GW)	1,000,000,000	(One Billion)	Watts
Terawatt (TW)	1,000,000,000,000	(One Trillion)	Watts
Gigawatt	1,000,000	(One Million)	Kilowatts
Thousand Gigawatts	1,000,000,000	(One Billion)	Kilowatts
Kilowatthours (kWh)	1,000	(One Thousand)	Watthours
Megawatthours (MWh)	1,000,000	(One Million)	Watthours
Gigawatthours (GWh)	1,000,000,000	(One Billion)	Watthours
Terawatthours (TWh)	1,000,000,000,000	(One Trillion)	Watthours
Gigawatthours	1,000,000	(One Million)	Kilowatthours
Thousand Gigawatthours	1,000,000,000	(One Billion)	Kilowatthours

Obtaining Copies of Data or the Form

Upon EIA approval of the *Electric Sales and Revenue*, the data become available for public use on a cost-recovery basis. Computer listings may be obtained by submitting a written request to:

Energy Information Administration, EI-541
Forrestal Building
U.S. Department of Energy
Washington, DC 20585

These data are also available on machine-readable tapes. Tapes may be purchased by using Visa, Master Card, or American Express cards, as well as money

orders or checks payable to the National Technical Information Service (NTIS). Purchasers may also use NTIS and Government Printing Office depository accounts. To place an order, contact:

National Technical Information Service (NTIS)
Office of Data Base Services
U.S. Department of Commerce
5285 Port Royal Road
Springfield, Virginia 22161
(703) 487-4650

Copies of the form and its instructions may be obtained from the National Energy Information Center (NEIC). The address is listed in the section "Contacts."

Glossary

Base Bill: A charge calculated by taking the rate from the appropriate electric rate schedule and applying it to the level of consumption.

Base Rate: A fixed per kilowatthour charge for electricity consumed that is independent of other charges and/or adjustments.

Block Rate Schedule: An electric rate schedule with a provision for charging a different unit cost for various increasing blocks of demand or energy. Usually a reduced price is charged on succeeding blocks.

Census Divisions: The nine geographic divisions of the United States established by the Bureau of the Census, U.S. Department of Commerce for statistical analysis. The boundaries of Census divisions coincide with State boundaries. The Pacific Division is subdivided into the Pacific Contiguous and Pacific Noncontiguous areas.

Classes of Service: Consumers grouped by similar characteristics in order to be identified for the purpose of setting a common rate for electric service. Usually classified into groups identified as residential, commercial, industrial and other.

Class Rate Schedule: An electric rate schedule applicable to one or more specified classes of service, groups of businesses, or customer uses.

Commercial Sector: The commercial sector is generally defined as nonmanufacturing business establishments, including hotels, motels, restaurants, wholesale businesses, retail stores, and health, social, and educational institutions. Electric utilities may classify commercial service as service that includes all consumers whose demand or annual use exceeds some specified limit. The limit may be set by the utility based on the rate schedule of the utility. Consumers (i.e. farms and irrigation) that the utility has no system for separating into residential, commercial, and industrial classifica-

tions, should be classified based on the schedule they most closely resemble. If there is no rate schedule distinction, utilities may define commercial consumers as those having a demand of less than 1000 kilowatts.

Consumer Charge: An amount charged periodically to a consumer for such utility costs as billing and meter reading, without regard to demand or energy consumption.

Cooperative Electric Utility: A group organized under the law into a utility company that will generate, transmit, and/or distribute supplies of electric energy to a specified area not being serviced by another utility. Such ventures are generally exempt from the Federal income tax laws. Most electric cooperatives have initially been financed by the Rural Electrification Administration, U.S. Department of Agriculture.

Cost of Service: A ratemaking concept used for the design and development of rate schedules to ensure that the filed rate schedules recover only the cost of providing the electric service at issue. These costs include operating and maintenance expenses, depreciation and amortization expenses, and income and other taxes found just and reasonable by the regulatory agency for ratemaking purposes plus, in the case of privately owned electric utilities, an allowance for a return on capital (usually computed by applying a rate of return to the rate base). This concept attempts to equate the cost incurred by the utility to the revenue received for the service provided to each of the consumer classes.

Demand (Electric): The rate at which electric energy is delivered to or by a system, part of a system, or piece of equipment, at a given instant or averaged over any designated period of time.

Demand Charge: That portion of the consumer's bill for electric service based on the consumer's maximum electric capacity usage and calculated based on the

billing demand charges under the applicable rate schedule.

Energy Information Administration (EIA): An independent agency within the U.S. Department of Energy that develops surveys, collects energy data, and does analytical and modeling analysis of energy issues. The Agency must meet the requests of Congress, other elements within the Department of Energy, Federal Energy Regulatory Commission, the Executive Branch, its own independent needs, and assist the general public, or other interest groups, without taking a policy position.

Economy of Scale: The principle that larger production facilities have lower unit costs than smaller facilities.

Electric Power Industry: The privately, publicly, federally and cooperatively owned electric utilities of the United States taken as a whole. This includes all electric systems serving the public: regulated investor-owned electric utility companies; Federal power projects; State, municipal, and other government-owned systems, including electric public utility districts; electric cooperatives, including generation and transmission entities. Excluded from this definition are the special purpose electric facilities or systems that do not offer service to the public.

Electric Rate: The price set for a specified amount of electricity in an electric rate schedule or sales contract.

Electric Rate Schedule: A statement of the electric rate and the terms and conditions governing its application, including attendant contract terms and conditions that have been accepted by a regulatory body with appropriate oversight authority.

Electric Utility: An enterprise that is engaged in the generation, transmission, or distribution of electric energy primarily for use by the public and that is the major power supplier within a designated service area. Electric utilities include privately owned, publicly owned, cooperatively owned, and government-owned (municipals, Federal agencies, State projects, and public power districts) systems.

Energy: The capacity for doing work as measured by the capability of doing work (potential energy) or the conversion of this capability to motion (kinetic en-

ergy). Energy has several forms, some of which are easily convertible and can be changed to another form useful for work. Most of the world's convertible energy comes from fossil fuels that are burned to produce heat that is then used as a transfer medium to mechanical or other means in order to accomplish tasks. Electrical energy is usually measured in kilowatthours, while heat energy is usually measured in British thermal units.

Federal Energy Regulatory Commission (FERC): A quasi-independent regulatory agency within the Department of Energy having jurisdiction over interstate electricity sales, wholesale electric rates, hydroelectric licensing, natural gas pricing, oil pipeline rates, and gas pipeline certification.

Flat and Meter Rate Schedule: An electric rate schedule consisting of two components, the first of which is a service charge, and the second a price for the energy consumed.

Flat Demand Rate Schedule: An electric rate schedule based on billing demand that provides no charge for energy.

Gigawatt (GW): One billion watts.

Gigawatthour (GWh): One billion watthours.

Industrial Sector: The industrial sector is generally defined as including manufacturing, construction, mining, agriculture, fishing, and forestry establishments under Standard Industrial Classification (SIC) codes 01-39. The utility may classify industrial service using the SIC codes, or based on demand or annual usage exceeding some specified limit. The limit may be set by the utility based on its own rate schedule. Sales for consumers (i.e. farms and irrigation) that the utility has no system for separating into residential, commercial, and industrial classifications, should be classified based on the classification of their rate most closely resembles. If there is no rate schedule distinction, utilities may define industrial consumers as those having a demand equal to or greater than 1,000 kilowatts.

Interdepartmental Sales: Includes amounts charged by the electric department at tariff or other specified rates for electricity supplied by it to other utility departments.

Investor-Owned Electric Utility: A class of utility that is investor owned and organized as a tax paying business, usually financed by the sales of securities in the capital market.

Kilowatt (kW): One thousand watts.

Kilowatthour (kWh): One thousand watthours.

Megawatt (MW): One million watts.

Megawatthour (MWh): One million watthours.

Other Sector: Electricity supplied to public street and highway lighting, other service to public authorities, service to railroads and and railways, and interdepartmental service.

Power (Electrical): An electric measurement unit of power called a voltampere is equal to the product of 1 volt and 1 ampere. This is equivalent to 1 Watt for a direct current system and a unit of apparent power is separated into real and reactive power. Real power is the work-producing part of apparent power that measures the rate of supply of energy and is denoted as kilowatts (KW). Reactive power is the portion of apparent power that does no work and is referred to as kilovars; this type of power must be supplied to most types of magnetic equipment, such as motors, and is supplied by generator or by electrostatic equipment. Voltamperes are usually divided by 1,000 and called kilovoltamperes (kVA). Energy is denoted by the product of real power and the length of time utilized; this product is expressed as kilowatthours.

Public Authorities: Electricity supplied to municipalities or divisions or agencies of State and Federal governments, usually under special contracts or agreements that are applicable only to public authorities.

Public Street and Highway Lighting Service: Electricity supplied and services rendered for the purpose of lighting streets, highways, parks, and other public places; or for traffic or other signal system service, for municipalities, or other divisions or agencies of State or Federal governments.

Publicly Owned Electric Utility: A class of utility that includes those utilities operated by municipalities, po-

litical subdivisions, utility or power districts, and State and Federal power agencies.

Railroad and Railway Electric Service: Electricity supplied to railroads and interurban and street railways, for general railroad use, including the propulsion of cars or locomotives, where such electricity is supplied under separate and distinct rate schedules.

Rate Base: The value of property upon which a utility is permitted to earn a specified rate of return as established by a regulatory authority. The rate base generally represents the value of property used by the utility in providing service and may be calculated by any one or a combination of the following accounting methods: fair value, prudent investment, reproduction cost, or original cost. Depending on which method is used, the rate base includes cash, working capital, materials and supplies, and deductions for accumulated provisions for depreciation, contributions in aid of construction, customer advances for construction, accumulated deferred income taxes, and accumulated deferred investment tax credits.

Residential Sector: The residential sector includes private household establishments that consume energy primarily for space heating, water heating, air conditioning, lighting, refrigeration, cooking, and clothes drying. The classification of an individual consumer's account, where the use is both residential and commercial, is based on principal use. Apartment houses are included.

Retail: Sales covering electrical energy supplied for residential, commercial, and industrial end-use purposes. Other small classes, such as agriculture and street lighting, also are included in this category.

Rural Electrification Administration (REA): A lending agency of the U.S. Department of Agriculture, the REA makes self-liquidation loans to qualified borrowers to finance electric and telephone service to rural areas. The REA also finances the construction and operation of generating plants, electric transmission and distribution lines, or systems for the furnishing of initial and continued adequate electric services to persons in rural areas not receiving central station service.

Sales: The amount of kilowatthours sold in a given period of time; usually grouped by classes of service, such as residential, commercial, industrial, and other. Other sales include public street and highway lighting,

other sales to public authorities, sales to railroads and railways, and interdepartmental sales.

Schedule: A statement of the pricing format of electricity and the terms and conditions governing its applications.

Seasonal Rates: Different seasons of the year are structured into an electric rate schedule whereby an electric utility provides service to consumers at different rates. The electric rate schedule usually takes into account demand based on weather and other factors.

Special Contract Rate Schedule: An electric rate schedule for an electric service agreement between a utility and another party in addition to, or independent of, any standard rate schedule.

Special Purpose Rate Schedule: An electric rate schedule limited in its application to some particular purpose

or process within one, or more than one, type of industry or business.

Tariff: A published volume of rate schedules and general terms and conditions under which a product or service will be supplied.

Time-of-Day Rate: The rate charged by an electric utility for service to various classes of customers. The rate reflects the different costs of providing the service at different times of the day.

Watt: The electrical unit of power. The rate of energy transfer equivalent to 1 ampere flowing under a pressure of 1 volt at unity power factor.

Watthour (Wh): An electrical energy unit of measure equal to 1 watt of power supplied to, or taken from, an electric circuit steadily for 1 hour.

Neal Moerschel (202/254-5640),
Chief of the Electric Data Systems Branch;

Lawrence Prete (202/254-5671),
Project Leader.

Specific information on sales, revenue, and average revenue may be directed to:

Linda Bromley (202/254-5653)

Preface

The *Electric Sales and Revenue* is prepared by the Survey Management Division, Office of Coal, Nuclear, Electric and Alternate Fuels; Energy Information Administration (EIA); U.S. Department of Energy. This publication provides information about sales of electricity, its associated revenue, and the average revenue per kilowatthour sold to residential, commercial, industrial, and other consumers throughout the United States. Previous publications presented data on typical electric bills at specified consumption levels as well as sales, revenue, and average revenue.

The sales, revenue, and average revenue per kilowatthour provided in the *Electric Sales and Revenue* are based on annual data reported by electric utilities for the calendar year ending December 31, 1990. The electric revenue reported by each electric utility includes the revenue billed for the amount of kilowatthours sold, revenue from income, unemployment and other State and local taxes, energy or demand charges, consumer service charges, environmental surcharges, franchise fees, fuel adjustments, and other miscellaneous charges. Average revenue per kilowatthour is defined as the cost per unit of electricity sold and is calculated by dividing retail sales into the associated electric revenue. The sales of electricity, associated revenue, and average revenue per kilowatthour provided in this report are presented at the national, Census division, State, and electric utility levels.

Target Audience

In the private sector, users of the *Electric Sales and Revenue* include researchers, analysts, and ultimately the policy- and decision-making members of electric utility companies. Other users include financial and investment institutions, economic development organizations, special interest groups, lobbyists, electric power associations, and the news media.

In the public sector, the users include analysts, researchers, statisticians, and other professionals engaged in regulatory, policy, and program areas for Federal, State, and local governments. The Congress and other legislative bodies will also be interested in general trends related to electricity at State and national levels. Data in this report can be used in analytic studies to evaluate new legislation and regulatory alternatives,

and to forecast future demand for electric power. Public service commissions and other special government groups share an interest in State-level statistics. These groups can compare the statistics for their States with those of other jurisdictions.

Coverage of Sources

Data published in the *Electric Sales and Revenue* are compiled from the Form EIA-861, "Annual Electric Utility Report." A brief description of the form follows. The form is described in more detail in Appendix B, "Technical Notes." Copies of the form and its instructions may be obtained from the National Energy Information Center (NEIC). The address is listed in the "Contacts" section.

The Form EIA-861 is a census of electric utilities in the United States, its territories, and Puerto Rico. The form is used to collect information on the production and sale of electricity from approximately 3,250 electric utilities (Figure 1). This publication presents data on the number of consumers, sales, and revenue reported on the Form EIA-861. Average revenue per kilowatthour presented in this publication are calculated by dividing sales into revenue. Since electric rates vary based on energy usage, average revenue per kilowatthour are affected by changes in the volume of sales.

Data on sales, revenue, and average revenue per kilowatthour presented in this publication differ somewhat from estimated data collected on the Form EIA-826, "Monthly Electric Utility Sales and Revenue Report with State Distributions," published in the *Electric Power Monthly* and in the *Electric Power Annual* for 1987 and prior years. Both forms use sectoral classifications based on similar classification of consumers by electric utilities. At the national level, the figures reported on the Forms EIA-861 and EIA-826 correspond fairly closely; however, some large differences have been observed at the State level. (For a more detailed discussion, see Appendix B.)

Data for the four power authorities of American Samoa, Guam, Puerto Rico, and the Virgin Islands are included only in detail-level tables, and not in the national, Census division, and State level statistics.

Profile

This chapter contains two sections. The “Background” section provides a discussion on 1) sales of electricity, its associated revenue, and the average revenue per kilowatthour sold to ultimate consumers; 2) the classes of electric utility ownership; and 3) the classes of service or sectors. The “Year at a Glance” section provides a summary of pertinent statistics during the year related to sales of electricity, associated revenue, and average revenue per kilowatthour.

Background

Sales, Revenue, and Average Revenue per Kilowatthour. Electric power is an integral part of our way of life. It is indispensable to the factory, the commercial establishment, the home, and even most recreational facilities. The unavailability of electric power causes inconvenience to customers as well as the economic loss of industrial production. Electric companies are responsible for ensuring an adequate and reliable source of electricity to all consumers in their service territories at a reasonable cost.

The service territory of an electric utility is geographically distinct and is usually composed of many different combinations of consumers. Electric utilities classify their consumers by different factors, such as demand, rate schedule, Standard Industrial Classification (SIC) code, distribution voltage, accounting methods, end-use applications, and other social and economic characteristics. Electric utilities use consumer classifications for planning (load growth, peak demands) and for determining their sales and revenue requirements (cost of service), from which they derive their rates.

Average revenue per kilowatthour is defined as the cost per unit of electricity sold and is calculated by dividing retail electric revenue by the corresponding sales of electricity. The average revenue per kilowatthour is calculated for all consumers and for each sector (residential, commercial, industrial, and other sales). The average revenue per kilowatthour represents an average of all consumption levels and rates. The electric revenue used to derive the average revenue per kilowatthour is the operations revenue reported by the electric utility. Operations revenue includes energy or demand charges, consumer service charges, environmental surcharges, fuel adjustments, other miscellaneous charges, and State and local taxes. State and local taxes are collected by the electric utility

as part of their billing process but are expensed out and passed along to the appropriate taxing authority.

Average revenue per kilowatthour is affected by changes in the rate schedules used by the electric utilities and by changes in the volume of electricity sales. Because fixed charges remain constant regardless of the volume of sales, average revenue per kilowatthour will decrease as the volume of sales increases. A change in average revenue per kilowatthour may occur when the volume of electricity sales changes (because of an increase/decrease in the use of electricity by the individual consumer or an increase/decrease in the number of ultimate consumers) across all sectors or within a specific sector. Generally, the rate schedules used by electric utilities are designed so that revenue increases more slowly as the volume of sales increases, lowering the average revenue per kilowatthour. The net effect of these trends on the average revenue per kilowatthour presented in this publication has not been determined. Average revenue per kilowatthour is in part impacted by class of utility ownership and by class of service (sector). Consequently, data in this publication are presented by class of ownership and sector.

Classes of Ownership. The electric power industry in the United States is a combination of over 3,200 investor-owned, publicly owned, Federal, and cooperative electric utilities. Historically, investor-owned electric utilities have been most successful in serving large, consolidated markets where economies-of-scale afforded the lowest prices. However, publicly owned, Federal, and cooperative electric utilities all have a role in producing, transmitting, and distributing electricity.

Like all private businesses, the fundamental objective of an investor-owned utility is to produce a return for its investors. The investor-owned electric utility either distributes its profits to stockholders as dividends or reinvests these profits. It is granted a service monopoly in certain geographic areas and is obliged to serve all consumers. As franchised monopolies, these utilities are regulated and required to charge reasonable prices, to charge comparable prices to similar classifications of consumers, and to give consumers access to services under similar conditions. Most investor-owned electric utilities are operating companies that provide basic services for the generation, transmission, or distribution of electricity. The majority of investor-owned utilities perform all three functions. There are approximately

260 investor-owned electric utilities operating in all States except Nebraska. The electric utilities in Nebraska consist primarily of municipal systems and public power districts. Hawaii is the only State in which all electricity generation is supplied by investor-owned electric utilities. Investor-owned electric utilities currently account for more than 75 percent of all electric utility generating capability, generation, sales, and revenue in the United States.

Publicly owned electric utilities are nonprofit local government agencies established to provide service to their communities and nearby consumers at cost, returning excess funds to the consumer in the form of community contributions, more economic and efficient facilities, and lower rates. Publicly owned electric utilities (which number approximately 2,000) include municipals, public power districts, State authorities, irrigation districts, and other State organizations. Most municipal utilities simply distribute power, although some larger ones produce and transmit electricity as well. They obtain their financing from municipal treasuries and from revenue bonds secured by proceeds from the sale of electricity. Public power districts and projects are concentrated in Nebraska (which has no investor-owned electric utilities), Washington, Oregon, Arizona, and California. Voters in a public utility district (PUD) elect commissioners or directors to govern the district independent of any municipal government. State authorities, like the Power Authority of the State of New York or the South Carolina Public Service Authority, are agencies of their respective State government. Irrigation districts may have still other forms of organization. In the Salt River Project, votes for the board of directors are apportioned according to the size of landholdings.

Cooperative electric utilities are owned by their members and are established to provide electricity to those members. These electric utilities operate in rural areas with a lower concentration of consumers because these areas were historically viewed as uneconomical operations for investor-owned electric utilities. They are incorporated under State law and are usually directed by an elected board of directors, which in turn selects a manager. The Rural Electrification Administration, the National Rural Utilities Cooperative Finance Corporation, the Federal Financing Bank, and the Bank for Cooperatives are the most important sources of debt financing for electric cooperatives. There are approximately 950 electric cooperatives currently doing business in 47 States. Cooperative electric utilities do not operate in Connecticut, Hawaii, and Rhode Island, or in the District of Columbia.

There are 10 Federal electric utilities in the United States. They are the Department of Defense-U.S. Army Corps of Engineers; the Department of Energy-Alaska, Bonneville, Southeastern, Southwestern, and Western Area Power Administrations; the Department of Interior-U.S. Bureau of Indian Affairs and the U.S. Bureau of Reclamation; the Department of State-International Water and Boundary Commission; and the Tennessee Valley Authority. The Federal electric utilities are primarily generators and wholesalers of electricity rather than distributors to ultimate consumers. Federal electric utilities operate more than 150 power plants and produce approximately 8 percent of the electricity generated in the United States. Most of the power plants are Federal hydroelectric projects initially designed for flood control and irrigation purposes. Federal power is not sold for profit, but to recover the cost of operations. Most Federal generation is sold for resale to municipals, cooperative electric utilities, and other nonprofit preference customers, as required by law. There are three major Federal producers of electricity: the Tennessee Valley Authority (TVA), the largest Federal producer, the U.S. Army Corps of Engineers (USCE), and the U.S. Bureau of Reclamation (USBR). The TVA markets its own power while the generation by the USCE, except for the North Central Division (St. Mary's Falls at Sault St. Marie, Michigan), and the USBR is marketed by four of the Federal power marketing administrations (PMA): Bonneville, Southeastern, Southwestern, and Western Area. The four PMA's also purchase energy for resale from other electric utilities in the United States and Canada. Alaska, the fifth PMA, operates its own power plants and distributes power to ultimate consumers. The majority of electricity generated by Federal electric utilities is sold for resale, not to ultimate consumers.

Classes of Service (Sectors). In general, consumers are divided into classes or sectors based on the type of service they receive. The sectorial categorization of ultimate consumers is determined by the electric utility based on its service territory, size, location, ownership, and regulatory structure. The generic sectors (*residential*, *commercial*, and *industrial*) reflect the type of service consumers receive.

The residential sector includes electricity supplied to private household establishments and apartment buildings where energy is consumed primarily for space heating, water heating, air conditioning, lighting, refrigeration, cooking, and clothes drying. Electricity supplied for irrigation could be included in this sector.

The commercial sector includes electricity supplied to nonmanufacturing business establishments, including hotels, motels, restaurants, wholesale businesses, and retail stores; and health, social, and educational institutions. An electric utility may classify commercial consumers as those consumers whose demand or usage exceeds some specified limit. The limit may be set by the electric utility based on its rate schedule.

The industrial sector includes electricity supplied to manufacturing, construction, mining, agriculture, fishing, and forestry establishments -- Standard Industrial Classification (SIC) codes 1 through 39. An electric utility may classify industrial consumers using these SIC codes, or it may classify industrial consumers based on demand or usage exceeding some specified limit. As in the commercial sector, the limit may be set by the electric utility based on its rate schedule.

Sales to other consumers include public street and highway lighting, railroads and railways, municipalities, divisions or agencies of State and Federal Governments under special contracts or agreements, and other utility departments, as defined by the pertinent regulatory agency and/or electric utility. Sales to these consumers, as well as the residential, commercial, and industrial consumers may be classified differently by each electric utility because of different rates, demand levels, and the economic activities of the consumers.

The Year at a Glance

In 1990, total sales of electricity to ultimate consumers were 2,713 billion kilowatthours and total revenue was \$178 billion (Table 1). Sales to the residential sector in 1990 were 924 billion kilowatthours and revenue was \$72 billion. The commercial and industrial sectors had sales of 751 and 946 billion kilowatthours, and revenue of \$55 and \$45 billion, respectively. The weighted average revenue per kilowatthour of electricity sold to ultimate consumers in the United States in 1990 was 6.6 cents (Table 2). The average revenue per kilowatthour for the residential sector was 7.8 cents in 1990. The average revenue per kilowatthour for the commercial and industrial sectors for 1990 were 7.3 and 4.7 cents, respectively.

Average Revenue by Sector and Type. Since Federal electric utilities have access to relatively low-cost financing and mostly utilize less expensive hydroelectric facilities, they have the lowest average revenue per kilowatthour of all the ownership classes and sectors.

The average revenue per kilowatthour of publicly owned electric utilities in the residential sector, at 6.4 cents, was 14 percent below that for cooperative electric utilities at 7.4 cents; and 22 percent below that of investor-owned electric utilities at 8.2 cents, (Table 2). The average revenue per kilowatthour of publicly owned electric utilities in the commercial sector, at 6.5 cents, was 8 percent below that for cooperative electric utilities at 7.1 cents; and 13 percent below that for investor-owned electric utilities at 7.5 cents. For the industrial sector, publicly owned and cooperative electric utilities both had average revenue per kilowatthour of 4.7 cents, 2 percent below that for investor-owned electric utilities at 4.8 cents.

Sales by Sector. Sales of electricity rose 2 percent in 1990, compared with an increase of 3 percent in 1989. A record for total sales of electricity was set in 1990 at 2,713 billion kilowatthours. Actual sales in the residential sector grew more in 1990 than in 1989 while actual sales in the other major end-use sectors grew less in 1990 (Table 3). Sales of electricity to the residential sector increased by 2 percent (18 billion kilowatthours) in 1990. The total output of industrial goods increased by 2 percent in 1990,¹ compared with 1989, which led to a 2-percent (20 billion kilowatthour) increase in industrial sales of electricity. Sales of electricity to the commercial sector increased by 3 percent (25 billion kilowatthours).

Revenue by Sector. The total revenue from sales of electricity was 4 percent more than in 1989 (Table 3). Revenue increased by 5 percent for the residential sector and by 6 percent for the commercial sector in 1990. Revenue for the industrial sector increased by 3 percent in 1990.

Sales by Type of Ownership. Among the ownership classes, investor-owned electric utilities accounted for 76 percent (2,071 billion kilowatthours) of total U.S. sales of electricity in 1990 (Table 4). Publicly owned electric utilities accounted for 14 percent (386 billion kilowatthours); electric cooperative utilities accounted for 7 percent (201 billion kilowatthours); and Federal electric utilities accounted for 2 percent (55 billion kilowatthours), of total U.S. sales in 1990. Investor-owned electric utilities reported a 2-percent (39 billion kilowatthours) increase from 1989 in sales of electricity to ultimate consumers, while Federal electric and publicly owned electric utilities reported 4-percent (2 and 14 billion kilowatthours, respectively) increases in sales of electricity. Sales of electricity for cooperative electric utilities increased by 6 percent (11 billion kilowatthours).

¹U.S. Department of Commerce, Bureau of Economic Analysis, *Survey of Current Business*, March 1991, Vol. 71, No. 3, p. S1.

Revenue by Type of Ownership. All ownership classes reported increases in revenue from sales of electricity in 1990, compared to 1989, except Federal electric utilities. Cooperative and publicly owned electric utilities both reported 5-percent increases. Investor-owned utilities reported a 4-percent increase in 1990 revenue, while Federal electric utilities reported a 12-percent decrease. (Table 4).

Average Revenue by Type of Ownership. In 1990, Federal electric utilities continued to have the lowest average revenue per kilowatthour at 3.1 cents, a 14-percent decrease from 1989 (Table 11). Federal electric utilities generally have lower average revenue per kilowatthour because they are exempt from income tax, have access to lower interest loans, and use less expensive hydroelectric power. In addition, many Federal hydroelectric projects are multi-purpose projects and only a portion of the costs are allocated to electricity. Federal electric utilities set rates to recover only the cost of service and generally have no distinc-

tion between rates for wholesale and retail consumers. Average revenue per kilowatthour for publicly owned electric utilities was also lower than that of investor-owned electric utilities and cooperative electric utilities. Publicly owned electric utilities have access to low-cost capital and are not allowed to charge a return for profit. Publicly owned electric utilities had an average revenue per kilowatthour of 5.9 cents in 1990, a 2-percent (0.1 cents) increase from 1989.

Investor-owned electric utilities had an average revenue per kilowatthour of 6.8 cents in 1990, a 3-percent increase from 1989 (Table 11). Although cooperative electric utilities have access to low-cost loans through the Rural Electrification Administration, they had one of the highest average revenue per kilowatthour at 6.8 cents in 1990, a 1-percent decrease from 1989. The higher average revenue per kilowatthour by this ownership group is at least partly attributable to the high cost of operating in remote rural areas having a low concentration of consumers.

Table 1. Sales to Ultimate Consumers and Associated Revenue by Sector, 1990

Item	Residential	Commercial	Industrial	Other ¹	Total
Sales (million kilowatthours) ..	924,019	751,027	945,522	91,988	2,712,555

Sales and Revenue

This chapter provides a discussion on revenue requirements, the allocation of revenue across sectors, and rate schedules. Also provided are summary statistics on the sale of electricity to ultimate consumers and the associated revenue. This information is provided at the national, Census division, and State levels.

Cost of Electricity

The process of determining the cost of electricity generally follows three stages: 1) revenue requirements are determined 2) the revenue is allocated to different classes of service (sectors) and 3) rate schedules for each sector are established.

Revenue Requirements. Revenue requirements are set to reimburse the electric utility for providing electric service. The revenue requirements reflect the anticipated cost of providing services for some period of time in the future, usually a year. Revenue requirements include investment depreciation, expenses for the production, transmission, and distribution systems, as well as sales costs, consumer costs, Federal and other taxes, and administration and general expenses. The revenue requirements also include an allowance for the profit of the electric utility, if applicable.

Allocation of Revenue. The cost of service to particular sectors and the mix of consumers served in the sectors provide guidelines for determining how much of the revenue must be collected from each sector. For example, the cost of service to the residential sector is usually higher than the cost to the commercial or industrial sectors because of the large number of consumers served, amount of distribution lines needed to provide the service, and the low consumption levels. The economic activity or type of business of the ultimate consumer is not necessarily the means by which electric utilities classify their consumers to determine revenue requirements and set rates. Electric utilities, in many instances, determine their revenue requirements and set their rates based on the level of demand and/or consumption of electricity.

The residential sector represents 88 percent of the total number of consumers but only accounts for 34 percent of the total sales of electricity and 41 percent of the revenue from those sales. The industrial sector possesses less than 1 percent of the total number of con-

sumers but accounts for 35 percent of the sales and 25 percent of the revenue. The commercial sector consists of 11 percent of the consumers, accounts for 28 percent of total sales and 31 percent of the revenue. The remaining share of sales is accounted for by the "other" sector, which includes public street and highway lighting, railroads and railways, municipalities, divisions or agencies of State and Federal Governments under special contracts or agreements, and other utility departments, as defined by the pertinent regulatory agency and/or electric utility. Investor-owned electric utilities serve approximately three-fourths of the total number of ultimate consumers. Publicly owned electric utilities and electric cooperatives serve nearly all the remaining ultimate consumers as federally owned electric utilities have very few retail sales and sell almost exclusively to other electric utilities.

Rate Schedules. In general, the rate schedules for most electric utilities are designed to allow for operation, generation, maintenance, rental fees for equipment, and demand and service charges. Operation, generation, maintenance, and rental fees for equipment are usually fixed charges that are assessed monthly or annually. Demand charges are also fixed, but they vary with respect to volume of sales. A more detailed discussion of these charges is contained in Chapter 3, "Average Revenue."

The rate schedules developed to generate revenue for electric utilities are unique to each utility. The rates reflect any number of considerations that are important to the economic welfare of the electric utility and may reflect other interests as well, such as residential rates that provide economic service to low-income families. Generally, commercial or industrial billings are determined more by the level of demand/consumption of electricity than by the type of economic activity in which the consumer is engaged.

For instance, while commercial and industrial consumers are billed according to a particular rate schedule that frequently reflects the type of business indicated by that schedule, there are exceptions. A light manufacturing establishment with a manufacturing process that consumes little energy could be billed at a commercial rate because its consumption is not high enough to fall into the industrial schedule. Conversely, a very large commercial building might have sufficiently large consumption to be billed at the industrial rate.

Sectorial classification of consumers may change over the course of a year as consumption varies. As a result, the rate schedule that would be applicable may vary. For example, a very large commercial building may have a high level of consumption during the summer because of air conditioning equipment and would be billed at industrial rates. However, in the winter, if the building is heated by gas, consumption of electricity may decline and commercial rates may be applied for billing purposes rather than industrial rates.

The authority for the approval of these rates is based on the class of utility ownership. For example, investor-owned electric utilities are regulated by State public service commissions and the Federal Energy Regulatory Commission. Publicly owned electric utilities, in

most States, are regulated by their consumer-owners through locally elected or appointed officials. A more detailed discussion on utility classes of ownership is contained in the "Introduction" section of the first chapter in this publication.

Data Sources. Tables 3 through 10 contain data on the retail sales of electricity, its associated revenue, and the average number of consumers at the national, Census and State levels by sector and class of utility ownership. Statistics contained in Tables 3 through 10 are based on data collected on the Form EIA-861, "Annual Electric Utility Report." Data for the four power authorities of American Samoa, Guam, Puerto Rico, and the Virgin Islands, are not included in the summary statistics.

Electricity provides energy to light homes and shopping centers, and to run factories.

Table 3. Sales to Ultimate Consumers and Associated Revenue by Sector, 1986-1990

Item	1990	1989	1988	1987	1986

Average Revenue per Kilowatthour

This chapter provides summary statistics on the average revenue per kilowatthour at the national, Census division, State, and electric utility levels.

Average Revenue per Kilowatthour at the National, Regional, and State Level

The average revenue per kilowatthour by sector and State is calculated by dividing total annual revenue by total annual retail sales for each sector and State. The resulting measurement is the cost per kilowatthour of electricity sold for providing service to a sector given the rate schedule of the electric utility for that particular sector. Many rate schedules have a minimum service charge and most have a declining rate per unit of consumption as consumption increases. Rate schedules for the commercial and industrial sectors almost always have a demand charge in addition to an energy charge. These charges lower the average revenue per kilowatthour as the average consumption increases.

The average revenue per kilowatthour for residential consumers is generally higher than for any other sector due in part to higher costs associated with serving many consumers who use relatively small amounts of electricity. These costs include direct-load costs (such as those for distribution lines, transformers, and meters)

in addition to consumer or administrative costs. The industrial sector, which generally includes consumers with the highest use of electricity, has the lowest rates due to the economies of serving a few consumers who use relatively large amounts of electricity. Average revenue per kilowatthour for the residential sector has increased slightly since 1986. The commercial and industrial average revenue per kilowatthour decreased from 1986 through 1988. Some State utility commissions, during this period, approved lower rates in the commercial and industrial sector in order to better represent the cost of service. In some instances, these lower rates were approved in order to stimulate use of electricity in the commercial and industrial sectors. In 1990, the average revenue per kilowatthour for the commercial sector increased from 1989, while it remained unchanged for the industrial sector.

Utility Demand Side-Management (DSM) programs designed to reduce system peak demands and energy requirements have become important components of utility load and resource plans. DSM programs are designed to modify consumption patterns and increase the efficient use of electricity. For this reason, utilities will be encouraged to create DSM programs and activities to be used by residential, commercial, and industrial consumers. These programs may play a role in changing the consumers average consumption and average revenue per kilowatthour. Public concern for

stricter environmental standards and Federal regulations have forced electric utilities to reduce or eliminate the release of gaseous power plant emissions. Since environmental equipment can be a significant part of the cost of a power plant, the recent passage of the Clean Air Act Amendments (CAAA) of 1990 may impact rates further as the initial capital cost of installation and the recurring operation and maintenance (O&M) costs will affect utility revenue requirements.

Federal electric utilities generally have the lowest average revenue per kilowatthour for the ownership classes because they have access to relatively low-cost financing and mostly utilize less expensive hydroelectric facilities. Because publicly owned electric utilities also have access to relatively low-cost financing and are nonprofit entities, they have lower average revenue per kilowatthour than investor-owned electric utilities. Although cooperative electric utilities have economic advantages similar to those of the publicly owned electric utilities, they generally serve sparsely populated areas. As a consequence, cooperative electric utilities generally have higher average revenue per kilowatthour than do investor-owned utilities.

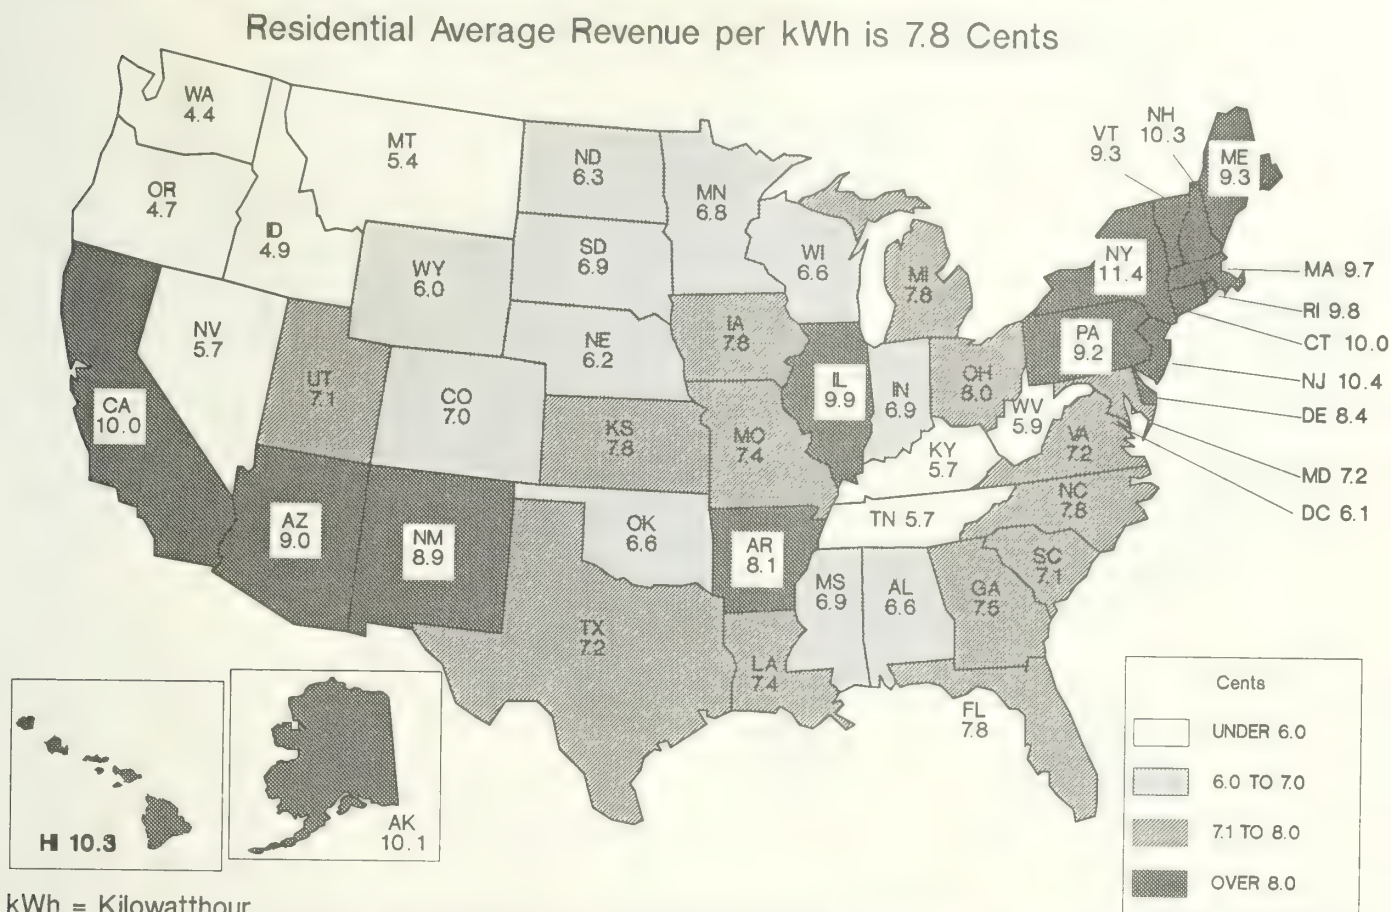

Because of the type and availability of capacity and the cost of fuel, the average revenue per kilowatthour differs across U. S. Census divisions. Petroleum is generally a more expensive energy source than coal and natural gas. Therefore, the New England and Middle Atlantic Census Divisions tend to have an average revenue per kilowatthour that is higher than average because of their reliance on petroleum, whereas the East and West South Central Divisions rely on gas-fired generation and the East North Central and South Atlantic Census Divisions rely on coal-fired generation. Because the Mountain Census Division relies on less expensive hydroelectric generation, the average revenue per kilowatthour in this region is usually below the national average for all classes of consumers. The Census divisions where Federal hydroelectric facilities provide significant amounts of electricity, such as the East South Central Census Division, also have lower than average revenue per kilowatthour.

Tables 11 through 13 contain summary statistics on the average revenue per kilowatthour of electricity sold at the national, Census division, and State level by sector and class of utility ownership. Data for the four power authorities of American Samoa, Guam, Puerto Rico, and the Virgin Islands are not included in the summary statistics.

A commercial electric meter with a remote transmitter/receiver unit, which relays information regarding consumption of electricity to a central control station.

Figure 13. Average Revenue per Kilowatthour for the Residential Sector by State, 1990

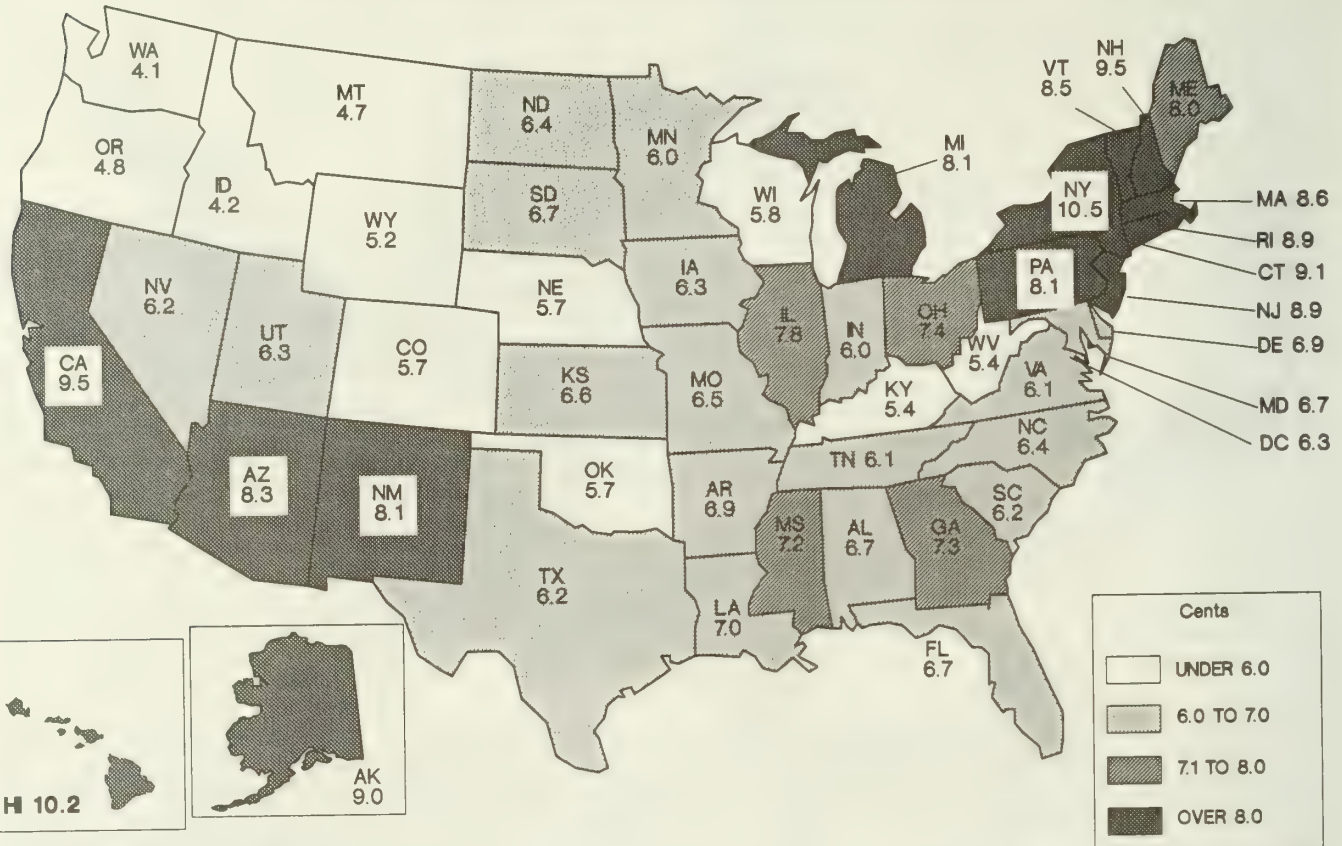

kWh = Kilowatthour.

Note: The average revenue per kilowatthour of electricity sold is calculated by dividing revenue by sales.

Notes: •The average revenue per kilowatthour of electricity sold is calculated by dividing revenue by sales. •The Form EIA-861 data shown in this publication differ somewhat from Form EIA-826, "Monthly Electric Utility Sales and Revenue Report with State Distributions," estimated data published in the *Electric Power Monthly* and in the *Electric Power Annual* for 1987 and prior years. See Appendix B for a detailed description of these differences.

Source: Energy Information Administration, Form EIA-861, "Annual Electric Utility Report."

Average Revenue per Kilowatthour at the Electric Utility Level

The average revenue per kilowatthour of electricity sold for each utility is calculated in this report by dividing the total annual revenue of the electric utility by its total annual sales of electricity across all sectors. Because the average revenue per kilowatthour varies between sectors, the difference in average revenue per kilowatthour between utilities may represent a difference in their proportion of sales in the different sectors. Accordingly, the average revenue for a given utility does not reflect the differences that may exist in its revenue structure across sectors. The average revenue per kilowatthour at the utility level is usually between 4 and 12 cents per kilowatthour but the average may be larger or smaller for a particular sector, ownership type, or State.

Cooperative electric utilities are owned by their members and are established to provide electricity to those members. These electric utilities operate in rural areas with a lower concentration of consumers because these areas were historically viewed as uneconomical operations for investor-owned electric utilities. Cooperative electric utilities generally have broader service areas with smaller consumer bases than other ownership types and, as a consequence, they tend to have higher average revenue per kilowatthour. Cooperative electric utilities that serve consumers in multiple States tend to have even broader service areas and higher

average revenue per kilowatthour. Because of these characteristics, the average revenue per kilowatthour for the majority of cooperative electric utilities is not provided in Tables 14 through 17 as they reported either less than \$100,000 of revenue or less than 1 million kilowatthours of sales.

For example, the Columbus Electric Cooperative, Incorporated, in New Mexico serves consumers in New Mexico as well as in Arizona. The residential average revenue per kilowatthour in Table 14 is 12.5 cents in New Mexico and 12.6 cents in Arizona. The commercial average revenue per kilowatthour in Table 15 is 10.9 cents for New Mexico. The commercial average revenue per kilowatthour is not provided for Arizona because the electric utility reported either less than \$100,000 of revenue or 1 million kilowatthours of sales in this State.

Federal electric utilities generally have the lowest average revenue per kilowatthour for the ownership classes because they have access to relatively low-cost financing and primarily utilize less expensive hydroelectric facilities. The Department of Energy, Western Area Power Administration (WAPA) serves residential consumers in California and Colorado (Table 14) and commercial consumers in Montana (Table 15); because WAPA reported either less than \$100,000 of revenue or 1 million kilowatthours of sales, the average revenue per kilowatthour is not provided in these tables.

Around-the-clock operation is required in order that electric utilities may satisfy the needs of consumers of electricity.

Of the 84 reporting electric utilities in Alaska, 83 utilities have average revenue per kilowatthour exceeding the U.S. average. This occurs in part due to the lack of economies of scale in Alaska and because of the high costs associated with generation and distribution. The electric utilities that have higher costs charge higher rates for electricity that are designed to recover these costs from their consumers. In 1985, Alaskan electric utilities that used diesel fuel for most of their power generation in 1984, those that are not located in the Anchorage, Fairbanks, and Juneau areas, and those not previously given a power production subsidy in 1980 and 1981, were given a rate rebate or Power Cost Equalization (PCE) subsidy by the State of Alaska. The PCE program was initially designed to compensate consumers served by electric utilities located in rural areas where transmission access is limited and generating with expensive diesel gas turbines is the only practical means of providing electricity. The Alaska Energy Authority (AEA) administers the subsidy with funds from a State statute since Alaska has no State income tax. Electric utilities qualifying for the PCE program are required to notify consumers of the cost of electric service and the cost minus the State equalization. Consumers receiving the subsidy do not actually pay the high rates. The subsidy is allocated to electric utilities based on consumer sector and demand for electricity within each sector. In Tables 14 through 17, the PCE subsidy has not been subtracted from the total revenue of those electric utilities receiving compensation for high energy costs.

One example of the subsidy is the Alaska Village Electric Cooperative, Incorporated (AVEC), which had a residential average revenue per kilowatthour of 41.0 cents in 1990 (Table 14). The AVEC had an average subsidy of 26.5 cents² for all consumer classifications except industrial (large commercial) consumers over 1,500 kilowatthours. The adjusted residential average revenue per kilowatthour would be approximately 19.5 cents and that is the price the consumer pays.

Electric utilities operating on islands with high seasonal populations also tend to have much higher average revenue per kilowatthour because higher demand charges are needed to recover the fixed equipment and operating costs associated with generating electricity at infrequent times. These electric utilities are few and are primarily located on the East Coast and in the

Great Lakes area. For example, the Fischer's Island Electric Corporation in New York serves residential and commercial consumers with average revenue per kilowatthour of 20.9 and 20.0 cents, respectively.³ Commercial consumers who use over 800 kilowatthours per month pay in addition to their energy charge a \$10.53 per kilowatt demand charge and all consumers pay an additional surcharge of about 12 percent with seasonal or vacation residential consumers paying a slightly higher surcharge than year round residential consumers.

Data on the number of consumers, revenue, sales, and average revenue per kilowatthour for individual electric utilities are contained in Tables 14 through 17. The average revenue per kilowatthour presented in Tables 14 through 17 are based on an average for each of the end-use sectors. When an electric utility provided service to ultimate consumers in more than one State, that utility is listed under each State it serviced. The electric utilities in Table 14 through 17 that provided service to ultimate consumers in more than one State and their percent of sales in each State are shown in Appendix A. Tables 14 through 16 contain the respective consumers, sales, revenue, and average revenue per kilowatthour by each sector for all electric utilities. Table 17 contains the respective sales, revenue, and average revenue for the sum of all sectors. This includes the residential, commercial, and industrial sectors, as well as public street and highway lighting, interdepartmental sales, sales to railroads and railways, and sales to other public authorities.

Electric revenue and sales data are reported by electric utilities in thousand dollars and thousand kilowatthours. Average revenue per kilowatthour for electric utilities with either less than \$100,000 of revenue or less than 1 million kilowatthours of sales, are not provided because the significance of these data are not sufficient to make the ratio meaningful. See Appendix B for further information.

Data Sources. Statistics contained in Tables 11 through 17 are based on data collected on the Form EIA-861, "Annual Electric Utility Report." Data for the four power authorities of American Samoa, Guam, Puerto Rico, and the Virgin Islands are included only in Tables 14 through 17, and not in the summary statistics.

²Alaska Public Utilities Commission, *Summary of Power Cost Equalization Participants*, (Anchorage, AK, October 1990).

³The commercial average revenue per kilowatthour in Table 15 is not provided because the magnitude of the data are too small to make the ratio meaningful. A slight change in sales or revenue could affect the average revenue per kilowatthour in these instances.

¹ The number of ultimate consumers is an average of the number of consumers at the close of each month.

² The average revenue per kilowatthour of electricity sold is calculated by dividing revenue by sales.

³ Most electric utilities in the State of Alaska that have average revenue per kilowatthour exceeding the U.S. average compensate their rural consumers through the State of Alaska, Power Cost Equalization (PCE) program. The PCE program was designed to offset the high generation and distribution costs that must otherwise be passed on to consumers in the form of high rates for electricity.

⁴ Electric revenue and sales data are reported by electric utilities in thousand dollars and thousand kilowatthours. Average revenue per kilowatthour for electric utilities with either less than \$100,000 of revenue or less than 1 million kilowatthours of sales, are not provided because the significance of the data are not sufficient to make the ratio meaningful.

Note: Electric utilities serving consumers in more than one State are listed under each State served.

Source: Energy Information Administration, Form EIA-861, "Annual Electric Utility Report."

¹ The number of ultimate consumers is an average of the number of consumers at the close of each month.

² The average revenue per kilowatthour of electricity sold is calculated by dividing revenue by sales.

³ Most electric utilities in the State of Alaska that have average revenue per kilowatthour exceeding the U.S. average compensate their rural consumers through the State of Alaska, Power Cost Equalization (PCE) program. The PCE program was designed to offset the high generation and distribution costs that must otherwise be passed on to consumers in the form of high rates for electricity.

⁴ Electric revenue and sales data are reported by electric utilities in thousand dollars and thousand kilowatthours. Average revenue per kilowatthour for electric utilities with either less than \$100,000 of revenue or less than 1 million kilowatthours of sales, are not provided because the significance of the data are not sufficient to make the ratio meaningful.

Note: Electric utilities serving consumers in more than one State are listed under each State served.

Source: Energy Information Administration, Form EIA-861, "Annual Electric Utility Report."

¹ The number of ultimate consumers is an average of the number of consumers at the close of each month.

² The average revenue per kilowatthour of electricity sold is calculated by dividing revenue by sales.

³ Most electric utilities in the State of Alaska that have average revenue per kilowatthour exceeding the U.S. average compensate their rural consumers through the State of Alaska, Power Cost Equalization (PCE) program. The PCE program was designed to offset the high generation and distribution costs that must otherwise be passed on to consumers in the form of high rates for electricity.

⁴ Electric revenue and sales data are reported by electric utilities in thousand dollars and thousand kilowatthours. Average revenue per kilowatthour for electric utilities with either less than \$100,000 of revenue or less than 1 million kilowatthours of sales, are not provided because the significance of the data are not sufficient to make the ratio meaningful.

Note: Electric utilities serving consumers in more than one State are listed under each State served.

Source: Energy Information Administration, Form EIA-861, "Annual Electric Utility Report."

State Electric Utility	Class of Ownership	Number of Consumers ¹	Revenue (thousand dollars)	Sales (thousand kilowatthours)	Average Revenue per kilowatthour ² (cents)
Wyoming (Continued)					
Wyrulec Co	Cooperative	3,227	4,080	50,559	8.1
Yampa Valley Electric Assn Inc	Cooperative	541	404	5,699	7.1

¹ The number of ultimate consumers is the sum across all sectors of the average number of consumers at the close of each month.

² The average revenue per kilowatthour of electricity sold is calculated by dividing revenue by sales.

³ Most electric utilities in the State of Alaska that have average revenue per kilowatthour exceeding the U.S. average compensate their rural consumers through the State of Alaska, Power Cost Equalization (PCE) program. The PCE program was designed to offset the high generation and distribution costs that must otherwise be passed on to consumers in the form of high rates for electricity.

⁴ Electric revenue and sales data are reported by electric utilities in thousand dollars and thousand kilowatthours. Average revenue per kilowatthour for electric utilities with either less than \$100,000 of revenue or less than 1 million kilowatthours of sales, are not provided because the significance of the data are not sufficient to make the ratio meaningful.

Note: Electric utilities serving consumers in more than one State are listed under each State served.

Electric Utilities Serving Ultimate Consumers in More Than One State

This appendix contains information from the Form EIA-861, "Annual Electric Utility Report," regarding electric utilities that serve ultimate consumers in more than one State (Table A1). Additionally, the percent of sales of electricity in each State is included in Table A1. The information can be used as a reference to Tables 14 through 17. For example, information contained in Table A1 indicates that the Appalachian Power Company serves consumers in the States of Virginia and West Virginia. Tables 14 through 17 contain the

respective sales, revenue, and average revenue by each sector and for all sectors for this electric utility in both States. The majority of utilities that serve ultimate consumers in more than one State are the investor-owned electric utilities. These electric utilities generally have large franchise service areas and historically have served in more than one State. Publicly owned electric utilities usually are chartered by municipal or State governments and usually provide service within the cities or counties where they are located.

Appendix B

Technical Notes

Technical Notes

Sources of Data

The *Electric Sales and Revenue (ESR)* is prepared by the Survey Management Division, Office of Coal, Nuclear, Electric and Alternate Fuels (CNEAF), Energy Information Administration (EIA), U.S. Department of Energy. Data published in the *ESR* are compiled from the EIA statistical Form EIA-861, "Annual Electric Utility Report." A brief summary of the form is presented below.

Form EIA-861

The Form EIA-861 is a mandatory census of electric utilities in the United States. The survey is used to collect information on power production and sales data from approximately 3,250 electric utilities. The data collected are used to maintain and update the electric utility frame data base of the EIA. This data base supports queries from the Executive Branch, Congress, other public agencies, and the general public. Summary data from the Form EIA-861 are also contained in the *Electric Power Monthly*, the *Electric Power Annual*, the *Financial Statistics of Selected Investor-Owned Electric Utilities*, the *Financial Statistics of Selected Publicly Owned Electric Utilities*, and the *Annual Outlook for U.S. Electric Power*. These reports present aggregate totals for electric utilities at the national, regional, and State level by consumer classes. Data for the four power authorities of the Virgin Islands, American Samoa, Guam, and Puerto Rico are included only in the detailed tables, and not in the summary statistics.

Instrument and Design History. The Form EIA-861 was implemented in January 1985 to collect data as of year-end 1984. The Federal Energy Administration Act of 1974 (Public Law 93-275) defines the legislative authority to collect these data.

Data Processing. The Form EIA-861 is mailed to the respondents in January to collect data as of the end of the preceding calendar year. The completed forms are to be returned to the EIA by April 1. These data are manually edited before being entered into the interactive on-line system. Internal edit checks are performed to verify that current data total across and between schedules, and are comparable to data reported the

previous year. Edit checks are also performed to compare data reported on the Form EIA-861 with similar data reported on the Forms EIA-826, EIA-412, and Federal Energy Regulatory Commission Form 1. Respondents are contacted by telephone to obtain clarification of reported data or to obtain missing data.

Form EIA-861 figures shown in this publication differ somewhat from the sum of the monthly Form EIA-826 figures for sales published in the *Electric Power Monthly* and in issues of the *Electric Power Annual* prior to 1988. Both forms use sectoral classifications (residential, commercial, and industrial) based on the usual classification of consumers by the electric utilities. At the national level, the Form EIA-861 and Form EIA-826 figures corresponded closely (within 3 percent) for all end-use sectors. Some larger differences were observed at the State level particularly for Tennessee due to inconsistent classification of commercial and industrial data between the Form EIA-826 and the Form EIA-861 surveys.

Differences between the Form EIA-861 and Form EIA-826 figures can result from the Form EIA-826 sampling procedure and/or from nonsampling error in either data collection. One source of nonsampling error in the Form EIA-826 stems from the practice of filing estimates for monthly sales and revenue when the actual figures are not yet available. Although respondents are instructed to file revisions, revisions are not always filed. The respondents are instructed to review their Form EIA-826 figures at the end of the reporting year to ensure consistency with Form EIA-861 figures. Survey analysts at the EIA compare these data series and attempt to resolve any differences. Nevertheless, some reporting differences remain.

Electric revenue and sales data are rounded and reported by electric utilities in thousand dollars and thousand kilowatthours. For this publication the average revenue per unit cost of electricity sold is calculated by dividing total electric revenue by the total sales of electricity. For Tables 14 through 17 the average revenue per kilowatthour for electric utilities with either less than \$100,000 of revenue or less than 1 million kilowatthours of sales, are not provided because the significance of the data are not sufficient to make the ratio meaningful. The average revenue per

kilowatthour for these electric utilities could change by more than one-half cent.

Quality of Data

The CNEAF office is responsible for routine data improvement and quality assurance activities. All operations in this office are done in accordance with formal standards established by the EIA. These standards are the measuring rod necessary for quality statistics. Data improvement efforts include verification of data-keyed input by automatic computerized methods, editing by subject matter specialists, and followup on nonrespondents. The CNEAF office supports the quality assurance efforts of the data collectors by providing advisory reviews of the structure of information requirements and of proposed designs for new and revised data collection forms and systems. Once implemented, the actual performance of working data collection systems is also validated. Computerized respondent data files are checked to identify those who fail to respond to the survey. By law, nonrespondents may be fined or otherwise penalized for not filing a mandatory EIA data form. Before invoking the law, the EIA tries to obtain the required information by encouraging cooperation of nonrespondents.

Completed forms received by the CNEAF office are sorted, screened for completeness of reported information, and keyed onto computer tapes for storage and transfer to random access data bases for computer processing. The information coded on the computer tapes is manually spot-checked against the forms to certify accuracy of the tapes. To ensure the quality standards established by the EIA, formulas that use the past history of data values in the data base have been designed and implemented to automatically check data input for errors. Data values that fall outside the ranges prescribed in the formulas are verified by telephoning respondents to resolve any discrepancies.

Data Editing System

Data from the Form EIA-861 are edited on an annual basis using automated systems. The edits include both deterministic checks, in which records are checked for the presence of required fields and their validity, and

statistical checks, in which estimation techniques are used to validate data according to their behavior in the past and in comparison to other current fields.

Confidentiality of the Data

The data collected on the forms used for input to this report are not confidential.

Formulas

Average Revenue per Kilowatthour. The average revenue per unit cost of electricity sold is calculated by dividing total annual revenue by total annual sales of electricity.

Rounding Rules for Data

Given a number with r digits to the left of the decimal and $d+t$ digits in the fraction part, with d being the place to which the number is to be rounded and t being the remaining digits that will be truncated, this number is rounded to $r+d$ digits by adding 5 to the $(r+d+1)$ th digit when the number is positive or by subtracting 5 when the number is negative. The t digits are then truncated at the $(r+d+1)$ th digit. The symbol for a rounded number truncated to zero is (*).

Data Correction Procedure

The CNEAF office has adopted the following policy with respect to the revision and correction of data published in energy data reports and made available in a machine format:

- Publication of these data results in their finalization at which point the data base is closed.
- Revisions or corrections are made only in the event a substantial (greater than 1 percent) reporting change is received or a substantial (greater than 1 percent) error is discovered.
- No revisions will be made without the approval of the Director, Survey Management Division.

Table B1. Unit-of-Measure Equivalents for Electricity

Unit	Equivalent		
Kilowatt (kW)	1,000	(One Thousand)	Watts
Megawatt (MW)	1,000,000	(One Million)	Watts
Gigawatt (GW)	1,000,000,000	(One Billion)	Watts
Terawatt (TW)	1,000,000,000,000	(One Trillion)	Watts
Gigawatt	1,000,000	(One Million)	Kilowatts
Thousand Gigawatts	1,000,000,000	(One Billion)	Kilowatts
Kilowatthours (kWh)	1,000	(One Thousand)	Watthours
Megawatthours (MWh)	1,000,000	(One Million)	Watthours
Gigawatthours (GWh)	1,000,000,000	(One Billion)	Watthours
Terawatthours (TWh)	1,000,000,000,000	(One Trillion)	Watthours
Gigawatthours	1,000,000	(One Million)	Kilowatthours
Thousand Gigawatthours	1,000,000,000	(One Billion)	Kilowatthours

Obtaining Copies of Data or the Form

Upon EIA approval of the *Electric Sales and Revenue*, the data become available for public use on a cost-recovery basis. Computer listings may be obtained by submitting a written request to:

Energy Information Administration, EI-521
Forrestal Building
U.S. Department of Energy
Washington, DC 20585

These data are also available on machine-readable tapes. Tapes may be purchased by using Visa, Master Card, or American Express cards, as well as money orders or checks payable to the National Technical Information Service (NTIS). Purchasers may also use NTIS and Government Printing Office depository ac-

counts. To place an order, contact:

National Technical Information Service (NTIS)
Office of Data Base Services
U.S. Department of Commerce
5285 Port Royal Road
Springfield, Virginia 22161
(703) 487-4650

Copies of the form and its instructions may be obtained from the National Energy Information Center (NEIC). The address and telephone number appear below.

National Energy Information Center, EI-231
Energy Information Administration
Forrestal Building, Room 1F-048
Washington, DC 20585

Glossary

Base Bill: A charge calculated by taking the rate from the appropriate electric rate schedule and applying it to the level of consumption.

Base Rate: A fixed per kilowatthour charge for electricity consumed that is independent of other charges and/or adjustments.

Block Rate Schedule: An electric rate schedule with a provision for charging a different unit cost for various increasing blocks of demand or energy. Usually a reduced price is charged on succeeding blocks.

Census Divisions: The nine geographic divisions of the United States established by the Bureau of the Census, U.S. Department of Commerce for statistical analysis. The boundaries of Census divisions coincide with State boundaries. The Pacific Division is subdivided into the Pacific Contiguous and Pacific Noncontiguous areas.

Classes of Service: Consumers grouped by similar characteristics in order to be identified for the purpose of setting a common rate for electric service. Usually classified into groups identified as residential, commercial, industrial and other.

Class Rate Schedule: An electric rate schedule applicable to one or more specified classes of service, groups of businesses, or customer uses.

Commercial Sector: The commercial sector is generally defined as nonmanufacturing business establishments, including hotels, motels, restaurants, wholesale businesses, retail stores, and health, social, and educational institutions. Electric utilities may classify commercial service as service that includes all consumers whose demand or annual use exceeds some specified limit. The limit may be set by the utility based on the rate schedule of the utility. Consumers (i.e. farms and irrigation) that the utility has no system for separating into residential, commercial, and industrial classifica-

tions, should be classified based on the schedule they most closely resemble. If there is no rate schedule distinction, utilities may define commercial consumers as those having a demand of less than 1000 kilowatts.

Consumer Charge: An amount charged periodically to a consumer for such utility costs as billing and meter reading, without regard to demand or energy consumption.

Cooperative Electric Utility: A group organized under the law into a utility company that will generate, transmit, and/or distribute supplies of electric energy to a specified area not being serviced by another utility. Such ventures are generally exempt from the Federal income tax laws. Most electric cooperatives have initially been financed by the Rural Electrification Administration, U.S. Department of Agriculture.

Cost of Service: A ratemaking concept used for the design and development of rate schedules to ensure that the filed rate schedules recover only the cost of providing the electric service at issue. These costs include operating and maintenance expenses, depreciation and amortization expenses, and income and other taxes found just and reasonable by the regulatory agency for ratemaking purposes plus, in the case of privately owned electric utilities, an allowance for a return on capital (usually computed by applying a rate of return to the rate base). This concept attempts to equate the cost incurred by the utility to the revenue received for the service provided to each of the consumer classes.

Demand (Electric): The rate at which electric energy is delivered to or by a system, part of a system, or piece of equipment, at a given instant or averaged over any designated period of time.

Demand Charge: That portion of the consumer's bill for electric service based on the consumer's maximum electric capacity usage and calculated based on the

billing demand charges under the applicable rate schedule.

Energy Information Administration (EIA): An independent agency within the U.S. Department of Energy that develops surveys, collects energy data, and does analytical and modeling analysis of energy issues. The Agency must meet the requests of Congress, other elements within the Department of Energy, Federal Energy Regulatory Commission, the Executive Branch, its own independent needs, and assist the general public, or other interest groups, without taking a policy position.

Economy of Scale: The principle that larger production facilities have lower unit costs than smaller facilities.

Electric Power Industry: The privately, publicly, federally and cooperatively owned electric utilities of the United States taken as a whole. This includes all electric systems serving the public: regulated investor-owned electric utility companies; Federal power projects; State, municipal, and other government-owned systems, including electric public utility districts; electric cooperatives, including generation and transmission entities. Excluded from this definition are the special purpose electric facilities or systems that do not offer service to the public.

Electric Rate: The price set for a specified amount of electricity in an electric rate schedule or sales contract.

Electric Rate Schedule: A statement of the electric rate and the terms and conditions governing its application, including attendant contract terms and conditions that have been accepted by a regulatory body with appropriate oversight authority.

Electric Utility: An enterprise that is engaged in the generation, transmission, or distribution of electric energy primarily for use by the public and that is the major power supplier within a designated service area. Electric utilities include privately owned, publicly owned, cooperatively owned, and government-owned (municipals, Federal agencies, State projects, and public power districts) systems.

Energy: The capacity for doing work as measured by the capability of doing work (potential energy) or the conversion of this capability to motion (kinetic en-

ergy). Energy has several forms, some of which are easily convertible and can be changed to another form useful for work. Most of the world's convertible energy comes from fossil fuels that are burned to produce heat that is then used as a transfer medium to mechanical or other means in order to accomplish tasks. Electrical energy is usually measured in kilowatthours, while heat energy is usually measured in British thermal units.

Federal Energy Regulatory Commission (FERC): A quasi-independent regulatory agency within the Department of Energy having jurisdiction over interstate electricity sales, wholesale electric rates, hydroelectric licensing, natural gas pricing, oil pipeline rates, and gas pipeline certification.

Flat and Meter Rate Schedule: An electric rate schedule consisting of two components, the first of which is a service charge, and the second a price for the energy consumed.

Flat Demand Rate Schedule: An electric rate schedule based on billing demand that provides no charge for energy.

Gigawatt (GW): One billion watts.

Gigawatthour (GWh): One billion watthours.

Industrial Sector: The industrial sector is generally defined as including manufacturing, construction, mining, agriculture, fishing, and forestry establishments under Standard Industrial Classification (SIC) codes 01-39. The utility may classify industrial service using the SIC codes, or based on demand or annual usage exceeding some specified limit. The limit may be set by the utility based on its own rate schedule. Sales for consumers (i.e. farms and irrigation) that the utility has no system for separating into residential, commercial, and industrial classifications, should be classified based on the classification of their rate most closely resembles. If there is no rate schedule distinction, utilities may define industrial consumers as those having a demand equal to or greater than 1,000 kilowatts.

Interdepartmental Sales: Includes amounts charged by the electric department at tariff or other specified rates for electricity supplied by it to other utility departments.

Investor-Owned Electric Utility: A class of utility that is investor owned and organized as a tax paying business, usually financed by the sales of securities in the capital market.

Kilowatt (kW): One thousand watts.

Kilowatthour (kWh): One thousand watthours.

Megawatt (MW): One million watts.

Megawatthour (MWh): One million watthours.

Other Sector: Electricity supplied to public street and highway lighting, other service to public authorities, service to railroads and and railways, and interdepartmental service.

Power (Electrical): An electric measurement unit of power called a voltampere is equal to the product of 1 volt and 1 ampere. This is equivalent to 1 Watt for a direct current system and a unit of apparent power is separated into real and reactive power. Real power is the work-producing part of apparent power that measures the rate of supply of energy and is denoted as kilowatts (KW). Reactive power is the portion of apparent power that does no work and is referred to as kilovars; this type of power must be supplied to most types of magnetic equipment, such as motors, and is supplied by generator or by electrostatic equipment. Voltamperes are usually divided by 1,000 and called kilovoltamperes (kVA). Energy is denoted by the product of real power and the length of time utilized; this product is expressed as kilowatthours.

Public Authorities: Electricity supplied to municipalities or divisions or agencies of State and Federal governments, usually under special contracts or agreements that are applicable only to public authorities.

Public Street and Highway Lighting Service: Electricity supplied and services rendered for the purpose of lighting streets, highways, parks, and other public places; or for traffic or other signal system service, for municipalities, or other divisions or agencies of State or Federal governments.

Publicly Owned Electric Utility: A class of utility that includes those utilities operated by municipalities, po-

litical subdivisions, utility or power districts, and State and Federal power agencies.

Railroad and Railway Electric Service: Electricity supplied to railroads and interurban and street railways, for general railroad use, including the propulsion of cars or locomotives, where such electricity is supplied under separate and distinct rate schedules.

Rate Base: The value of property upon which a utility is permitted to earn a specified rate of return as established by a regulatory authority. The rate base generally represents the value of property used by the utility in providing service and may be calculated by any one or a combination of the following accounting methods: fair value, prudent investment, reproduction cost, or original cost. Depending on which method is used, the rate base includes cash, working capital, materials and supplies, and deductions for accumulated provisions for depreciation, contributions in aid of construction, customer advances for construction, accumulated deferred income taxes, and accumulated deferred investment tax credits.

Residential Sector: The residential sector includes private household establishments that consume energy primarily for space heating, water heating, air conditioning, lighting, refrigeration, cooking, and clothes drying. The classification of an individual consumer's account, where the use is both residential and commercial, is based on principal use. Apartment houses are included.

Retail: Sales covering electrical energy supplied for residential, commercial, and industrial end-use purposes. Other small classes, such as agriculture and street lighting, also are included in this category.

Rural Electrification Administration (REA): A lending agency of the U.S. Department of Agriculture, the REA makes self-liquidation loans to qualified borrowers to finance electric and telephone service to rural areas. The REA also finances the construction and operation of generating plants, electric transmission and distribution lines, or systems for the furnishing of initial and continued adequate electric services to persons in rural areas not receiving central station service.

Sales: The amount of kilowatthours sold in a given period of time; usually grouped by classes of service, such as residential, commercial, industrial, and other. Other sales include public street and highway lighting,

other sales to public authorities, sales to railroads and railways, and interdepartmental sales.

Schedule: A statement of the pricing format of electricity and the terms and conditions governing its applications.

Seasonal Rates: Different seasons of the year are structured into an electric rate schedule whereby an electric utility provides service to consumers at different rates. The electric rate schedule usually takes into account demand based on weather and other factors.

Special Contract Rate Schedule: An electric rate schedule for an electric service agreement between a utility and another party in addition to, or independent of, any standard rate schedule.

Special Purpose Rate Schedule: An electric rate schedule limited in its application to some particular purpose

or process within one, or more than one, type of industry or business.

Tariff: A published volume of rate schedules and general terms and conditions under which a product or service will be supplied.

Time-of-Day Rate: The rate charged by an electric utility for service to various classes of customers. The rate reflects the different costs of providing the service at different times of the day.

Watt: The electrical unit of power. The rate of energy transfer equivalent to 1 ampere flowing under a pressure of 1 volt at unity power factor.

Watthour (Wh): An electrical energy unit of measure equal to 1 watt of power supplied to, or taken from, an electric circuit steadily for 1 hour.
